CHAMBA, a district in the Western Himalaya South of Jammu, between L 32° 33' N, and L 75° 76' E The town of Nupur is 2050 feet above the sea This Rajpoot prin-

Area, Square miles	3,216
Population	1,20,000
Revenue Rs	120,000
Tribute	10,000

cipality came into the possession of the British government in 1846, and part of it was made over to

maharajah Golab Singh By an agreement with the maharajah of Cashmere in 1847 Chumba came again entirely under the British government, and a sunnud was given to rajah Siree Sing, assigning the Chumba territory to him and to his male heirs, who are entitled to inherit according to the Shastras, and on failure of direct issue, to the heirs of the brothers according to seniority In 1854, the sanatorium of Dalhousie in the Chumba territory, was made over to the British by the rajah, the stipulation being that Rupees 2,000 should be remitted from the yearly tribute, which now stands at Rupees 10,000 A Sunnud was given to the rajah, conferring on him the right of adoption Chamba, Kuppoothulla, Mundee and Sookert are four chieftaincies in the North West of India and Punjab

*Sookert*, an ancient Rajpoot principality which came into possession of the British government by the Treaty of Lahore In 1864

full sovereignty was conceded to the rajah Oogun Sen, his heirs and those of his brothers according to seniority, unless specially set aside by Government for incapacity or misconduct The right of adoption has been conferred on the rajah by sunnud —*Archieson's Treaties, &c, page 375*

*Kuppoothulla* —The chief of Kuppoothulla at one time held possessions both in Cis and Trans-Sutlej, and also in the B aree Doab The scattered

possessions in the B aree Doab were gained by the sword, and were the first acquisitions made by sirdar Jussu Sing, the founder of the family In them lies the village of Aloo, whence the family spring, and from which the designation "Aloowalia" is derived The Trans Sutlej estates were also acquired by conquest, and from the chief city

therein, Kuppoothalla, the family derives its general designation Of the Cis-Sutlej possessions, some were conquered, and some were granted by maharajah Runjeet Sing, prior to September 1808 The total value of the Cis-Sutlej possessions was estimated at Rupees 565,000 By a treaty of the 25th April 1809, the sirdar of Kuppoothulla was pledged to furnish supplies to British troops moving through or encamped in his Cis-Sutlej territory, and by article five of the Declaration of the 6th May 1809, he was bound to the British standard with his followers during war In 1826 the sirdar, Futeh Sing, fled to the Cis-Sutlej states for the protection of the British Government against the aggressions of Runjeet Sing, and protection was accorded It was declared that the Aloowalia chief was under British protection in respect to his ancestral possessions east of the Sutlej, but dependent on Lahore for places conferred by the Lahore Government prior to September 1808, viz, Bussee, Nairangurh and Jugraon The protection of the British Government, however, extended over both In the first Sikh war the troops of Kuppoothulla fought against the British at Aleewal, and, in consequence of these hostilities, and of the failure of the sirdar to furnish supplies from his Cis-Sutlej estates to the British Army, the Cis-Sutlej estates were confiscated

In 1819 sirdar Nihal Singh was created a rajah He died in September 1852, and was succeeded by his son, Rundheer Sing During the mutiny of 1857 and subsequently in Oudh in 1858, the rajah Rundheer Sing rendered service to the British The government, among other rewards, remitted a year's tribute, and permanently reduced the tribute to its former amount, viz, Rupees 1,31,000 For his services in Oudh the rajah received the estates of Bonudce and Bithowlee in perpetuity, with remission of half the revenue, and he has been guaranteed the right of adoption —*Archieson's Treaties, &c, page 373*

*Mundee* —This ancient Rajpoot principality came into the possession of the British Government by the Lahore Treaty of the 9th March 1846 Full sovereignty was conceded to the

rajah Bulbeer Sen, his heirs and those of his brothers, according to seniority, unless specially set aside by Government for incapacity or misconduct The right of adoption has been conferred on the rajah by sunnud —*Archieson's Treaties, &c, page 374*

CHAMBA An idol of the Tibetans

CHAMBA HIND Michela champaca,

*Prinsepia utilis*, *Jasminum grandiflorum*, and *J. officinale*

**CHAMBA GUDDI**, a race who occupy the Kangra valley, near the Chamba range of hills. They call themselves rajputs, and may always be known by their peculiar conical caps, with lappets to turn down over their ears, like an English travelling cap. They are shorter and stouter and stronger than their neighbours, are sharp and able, and impose upon their less knowing neighbours. Most of the witch finders are chamba guddi. When Europeans first visited the Kangra valley, they would drink or eat from their hands, and had very slight notions of caste, but since their intercourse with the people of the plain they have become as bigoted as any hindus.

**CHAMBAL** HIND *Ranunculus arvensis*

CHAMULI HIND *Michelia champaca*

CHAMUNA HIND The edible bulb or nut like root of *Cyperus bulbosus*, or allied species

CHAMUNDA, in hindoo mythology, as related in the Durga Mahatmya, an emanation of the goddess Durga, springing from her forehead to encounter the demons and Munda, detached to seize the latter by the sovereign of the Daitya, Sunbha, and her appearance, which is thus described in the Markandeya Purana, accords in most respects with the allusions to these points "From the forehead of Ambika, contracted with wrathful frowns, springing swiftly forth a goddess of black and of formidable aspect, armed with a scymitar and noose, bearing a ponderous mace, and decorated with a garland of dead corpses, robed in the hide of an elephant, dry and withered, and hideous, with yawning mouth and lolling tongue and bloodshot eyes, and filling the regions with her shouts" Having slain the demons, she bore their heads to her parent goddess, who told her that having slain Chanda and Munda, she should thenceforth be known on earth as Chamunda. She is also termed Kali from her black colour, and Karala or Karahvadana from her hideous countenance (*Hind Theat Vol 11, p 57*) It is to this hindoo goddess that all human sacrifices are made by hindoos The existence of anthropophagi, was known to ancient writers, but latterly discredited. They are mentioned in *Mundeville's Travels*, 228, and as living in Sumatra, cannibals devouring human flesh, (*Anderson, Mission to Sumatra*, 224) and their existence is no longer doubted. Their prototypes, the Issedones of Scythia or the Altai, (*Herod 1 216*, in 99 iv 25) and the Indian Padei, did not excel them in barbarity According to Dr Watson the "Aghorpunti or Aghori are a class of people who frequent the ghats at Benares, though they are occasionally to be found in other parts of India, and have been met with even in Assam They are Ogres (indeed, the similitude of the word of Aghoree is noticeable), and affect a practical philosophy, which disbelieves the existence of any difference between things, and asserts that all distinctions depend upon the imagination A cuff or a kick is as immaterial to them as a blessing

They go about *in puris naturalibus*, with a fresh human skull in their hands (off which they had previously eaten the putrid flesh, and afterwards scraped out the brain and eyes with their fingers), into which is poured whatsoever is given them to drink and to this they pretend to be indifferent whether it be ardent spirits or milk or foul water. For food they take the first thing which offers, whether it be a putrid corpse, cooked food, or ordure. With matted hair, blood-red eyes, and body covered with filthy vermin, the Aghori is an object of terror and disgust. He looks like a wolf, ready to destroy and then devour his prey, rather than a human being. Hindoos, however, look on these wretches with veneration, and none dare to drive them from their doors. They are among the worst of the many turbulent and troublesome inhabitants of Benares and there is scarcely a crime or enormity which has not, on apparently good grounds, been laid to their charge. One of the ancient Hindoo dramatists, Bhava Bhutt, who flourished in the eighth century, in his drama of *Malati and Madhava*, has made powerful use of the Aghori in a scene in the 'Temple of Chamunda, where the heroine of the play is decoyed in order to be sacrificed to the dread goddess Chamunda or Kali. The disciple of 'Aghora Ghanti,' the high priest who is to perform the horrible rite, by name 'Kalapa Kundala,' is interrupted in his invocation to Chamunda by the hero Mahdava, who thus describes the scene —

Now wake the terrors of the place, beset  
With crowding and malignant fiends. The flames  
From funeral pyres scarce lend their sullen light,  
Clogged with their fleshly prey, to dissipate  
The fearful gloom that hems them round  
Well be it so I seek and must address them

\* \* \* \* \*

How the noise

High, shrill, and indistinct, of chattering sprites,  
Communicative fills the charnel ground  
Strange forms like foxes flit along the sky  
From the red hair of their lank bodies darts  
The meteor blaze or from their mouths that stretch  
From ear to ear thickset with numerous fangs,  
Or eyes, or beards, or brows, the radiance streams,  
And now I see the goblin host each stalks  
On legs like palm-trees a gaunt skeleton,  
Whose fleshless bones are bound by starting sinews  
And scantly cased in black and shrivelled skin,  
Like tall and withered trees by lightning scathed,  
They move, and as amidst their sapless trunks  
The mighty serpent curls—so in each mouth  
Wide yawning, lolls the vast blood dripping tongue

They mark my coming, and the half-chewed morsel  
Falls to the howling wolf—and now they fly

Act V—Scene 1 H H Wilson's Translation

The belief in the horrible practices of the Aghori priesthood is thus proved to have existed at a very remote period, and doubtless refers to those more ancient and revolting rites which belonged to the aboriginal superstitions

of India, antecedent to the Aryan-Hindoo invasion and conquest of the country. It might be supposed that any such indecent, flagrant, and disgusting customs as are now practised by the Aghori might be summarily suppressed under the provisions of the new Penal Code of India. The worshippers of Sakti of Siva, under the terrific forms of Chamunda, Chinna-mustaka and Kali, are called Kerari, and represent the Aghora Ghunta and Kipalika. The word Chamunda, according to Ward, is from *charoo*, good, and *mundu*, a head.

*The people of India, a Series of Photographic Illustrations, with Descriptive Letterpress of the Races and tribes of Hindustan.* Edited by J Forbes Watson and John William Kaye. **CHANDNI HIND** Silver, a white cloth spread on a carpet

**CHANDNI HIND** The practice amongst Brahmins, Charans, and others of wounding or killing themselves, in order to extort alms or payment.—*Wilson* See Chandri

**CHANDOO**, the extract of opium which is employed in opium smoking The opium, as sent from Calcutta, is in boxes containing forty balls, each of the size of a 32lb cannon shot These balls are enclosed in a husk of compressed poppy leaves, and contain a certain quantity of moist opium inside, but which, in this state, is unfit for smoking,

for which it is prepared by four processes, in the following manner About three or four o'clock in the morning, fires are lighted, and, as the *first* process, a ball is divided into two equal halves by one man, who scoops out, with his fingers, the soft part inside, and throws it into an earthen dish, frequently, during the operation, moistening and washing his hands in another vessel, the water of which is carefully preserved, into which, also, is thrown the hardened poppy leaf-husks, when all the removable opium is obtained

In the *second* operation, the husks are boiled until all their adhering opium is dissolved, strained through a double filter of cloth and China paper The strained fluids are then mixed with the opium that was scooped out in the first operation, and boiled down in a large iron pot to the consistence of treacle The refuse is dried and sold to Chinese, who adulterate good opium with it, and the filter paper is used by the Chinese as an external application, in affections of the lower bowels

In the *third* operation the dissolved treacle-like mass is seethed over a charcoal fire, strong and steady, but not fierce temperature, during which it is worked, spread out, and again and again worked up to expel the water but prevent it burning When brought to the proper consistence, it is divided into half a dozen lots, each of which is spread like a plaster on a nearly flat iron pot, to the depth of from half to three quarters of an inch, and then scored in all directions to allow the equal application of heat One pot after another is then placed over the fire, turned rapidly round, then reversed, so as to expose the opium itself to the full heat of the red fire This is repeated three times, the time and proper heat being judged by the workman from the aroma and colour In this part of the process the greatest delicacy is demanded, for a little more or less fire would destroy the morning's work or 300 or more dollars worth of opium The head workmen in Singapore are men who have learned their trade in China, and from their great experience are paid very high wages

The *fourth* operation consists in re-dissolving this fired opium in a large quantity of water, and boiling it in copper vessels till it be reduced to the consistence of the Chandoo of the shops, the degree of tenacity being the index of its complete preparation, which is judged of by drawing it out by slips of bamboo The quantity of chandoo obtained from the soft opium is about 75 per cent But, from the gross opium, that is, including the opium and the bark, the proportion is not more than from 50 to 54 per cent

In this lengthened seething process, the chandoo or extract becomes less irritating and more soporific, the vegetable matter, the resin and oil, the extractive matter and a little being all thrown out in the refuse matter. The quantity of Chandu obtained from the soft opium is about 75 per cent, but from the gross opium, that is, including the opium and the husk, the proportion is not more than from 50 to 54 per cent. *J I A, No 1 Jany 1848 Dr Little, Ceylon, p 215, 216*

CHANDRA, in hindu mythology, the moon. Mooi tells us it is usually a male deity sometimes, however, feminine Chandri, and in such character, is more commonly applied to Parvati or Devi, the consort or Sacti of Siva than to any other goddess. Lakshmi Devi, or simply Devi as the consort of Vishnu is often called, occasionally coalesces with Parvati, and both, as well as Saraswati, spouse of Brahma, may be identified with the moon or Luna. Thus, in hindu mythology, the sun and moon, being sometimes regarded as male deities, the three principal female divinities hold a similar union with their respective solar lords. According to Coleman, Chandra or Soma, the Moon is described as the male, and is painted young, beautiful, and of dazzling fairness, two-armed, and having in his hands a club and a lotus. He is usually riding on or in a cart drawn by an antelope. Although Soma or Chandra is thus described as male, the moon is occasionally

represented as Chandri, a female, in which character being visited by Surya, she produced a numerous family called Pulinda. In the third volume of the *Asiatic Researches*, this sexual change is accounted for by Colonel Wilford, who says, when the moon is in opposition to the sun, it is the god Chandra, but when in conjunction with it, the goddess Chandri, who is in that state feigned to have produced the Pulinda. The moon was also worshipped as male and female, Lunus and Luna, by the Egyptians, the men sacrificing to it as Luna, the women as Lunus, and each sex, on these occasions, assuming the dress of the other. The hindus have in their zodiac twenty-seven lunar mansions, called Nakshatra, or daily positions of the moon, and as, to perfect the revolutions, some odd hours are required, they have added another not included in the regular chart. These twenty-eight diurnal mansions form the zodiac having been invented by Daksha, are personified as the daughters of the deity, and are the mythological wives of Chandra. In the chart of the lunar mansions they are curiously represented as a horse's head, a yoni, a razor, an arrow, a wheel, a bedstead, a house, &c — *Cole Myth Hind p 131*. The *Du Majores* of the rajpoot are the same in number and title as amongst the Greeks and Romans, being the deities who figuratively preside over the planetary system. Their grades of bliss are therefore in unison with the eccentricity of orbit of the planet named. On this account Chandra or Indu, the moon, being a mere satellite of Ella, the earth, though probably originating the name of the *Indu* race, is inferior in the scale of blissful abodes to that of his son Budha or Mercury, whose heliacal appearance gave him importance even with the sons of Vaiva, the sun. From the poetic seers of the martial races we learn that there are two distinct places of reward, the one essentially spiritual, the other of a material nature. The bard inculcates that the warrior who falls in battle in the fulfilment of his duty, "who abandons life through the wave of steel," will now know no "second birth," but that the unconfined spark (*jote*) will reunite to the parent orb. The doctrine of transmigration through a variety of hideous forms, may be considered as a series of purgatories. The Greeks and Celts worshipped Apollo under the title of Carneios, which, according to Theocritus, is derived from Carnos, who having prophesied the misfortunes to the Heracles in their inroads on the Peloponnesus one of them, called Hippotes, slew him. One of the titles of the Hindu Apollo is Carna, 'the radiant,' from *carina* 'a ray' and when he led the remains of the *Herwila* in company

with Baldeva (*the god of strength*), and Yudishtra, after the great international war, into the Peloponnesus of Surashtra, they were attacked by the aboriginal Bhil, one of whom slew the divine Cirna with an arrow. The Bhil claim to be *Hyanasa*, or of the race of *Hya*, whose chief seat was at Maheswar on the Nerbudda. The assassin of Cirna would consequently be Hiputa, or *descendant* of *Hya*. In Hindu astronomy Chandra is the most common name of the moon. Chandra panchanga, is the Luni solar Kalendar.—*Mocci Tod Coleman*. See Sariswati, Surya.

CHANDRA, a son of Atri, and father of Bndha by Tara. Tara was the wife of his teacher Vrihaspati.

CHANDRA RIVER, unites with the Bhaga and is then styled the Chenab. In the parts of Ladak, through which the Chandra and Bhaga rivers run, their banks are Bhut, up to their junction, after that, human. See Ladak.

CHANDRAGANA. See Inscriptions p. 376.

CHANDRAGUPTA, the Sandracottus of the Greeks, the founder of the Mauryan dynasty of Magadha. He was the illegitimate son of the last Nanda by the beautiful, but low caste Mura, from whom he obtained the designation of *Maurya*. In the Mudra Rakshasa, a Sanskrit drama detailing his elevation, Chandra Gupta is, however, frequently named Vrishala, a term said to be equivalent to *Sudra*, and as Nanda himself was the son of a *Sudra* woman, there can be little doubt that the celebrated *Maurya* family were of *Sudra* extraction. In the early part of his career, Chandra Gupta led a wandering life in the Punjab (See Turnour, Introduction to the Mahawanso, p. xli, quoting the Tika or Commentary), and was most probably engaged with his fellow-countrymen in opposing Alexander. His chief adviser, the brahmin Chanakya, was a native of Takshasila or Taxila, the capital of the Western Punjab, and it was in that country that Chandra Gupta first established himself by the complete expulsion of the Greek troops left by Alexander (*Justin* xv. 4—"Auctor libertatis Sandrocottus fuerat"). It would appear that the Greek colonists in the Punjab had first been placed un-

der Philip, while the civil administration of the country remained in the hands of its native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (*Anabasis* vi. 2, vii) directed *Eudemus* and *Taxiles* to govern the country until he should send another deputy. It is probable, however, that they continued to retain the charge, for after Alexander's death in B. C. 323, *Eudemus*, contrived by the treacherous assassination of king Porus by his general Eumenes, to make himself master of the country (*Diodorus* xix, 5). Some few years later, in B. C. 317, he marched to the assistance of Eumenes, with 3,000 infantry and 5,000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected, and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs,—(*Justin* xv. 4—"Præfactos ejus occiderat" again "*Molentibus deinde bellum adversus præfactos Alexandri*") Chandra Gupta was present when Porus was murdered. He afterwards became the leader of the national movement, which ended in his own elevation to the sovereignty of the Panjab. Justin attributes his success to the assistance of *banditti* (*Justin* xv. 4—"Contractis latronibus Indos ad novitatem regni sollicitavit"). But in this, Colonel Cunningham thinks he has been misled by a very natural mistake, for the Ariatta, who were the dominant people of the Eastern Panjab, are never mentioned in the Mahabharata without being called robbers, (*Lassen, Pentapot Indica*—"Ariatti profecto latrones," and "*Bahica latrones*"). The Sanskrit name is Ariashtra, the "kingless," which is preserved in the *Adrastrate* of Arrian, who places them on the Ravi. They were the republican defenders of Sangala, or Sakala, a fact which points to their Sanskrit name of *Ariashtra*, or "kingless." But though their power was then confined to the eastern Panjab, the people themselves had once spread over the whole country—"Ubi fluvii illi quivi \* \* \* ibi sedes sunt Ariatorum"—*Lassen, Pentapot Indica, from the Mahabharat*. They were known by the several names of *Bahika*, *Jantika*, and *Takha*, of which the last would appear to have been their true appellation, for their old capital of *Taxila* or *Takhasila* was known to the Greeks of Alexander, and the people themselves still exist in considerable numbers in the Panjab hills. The *ancient* extent of their power is proved by the *present* prevalence of their alphabetical characters, which under the name of *Takri*, or *Takri*, are now used by all the Hindus of Kashmir and the

northern mountains, from Simla and Sabathu to Kabul and Bamian. On these grounds, Major Cunningham identifies the banditti of Justin, with the *Takka*, or original inhabitants of the Punjab, and assigns to them the honour of delivering their native land from the thralldom of a foreign yoke. This event occurred most probably about 316 B C, or shortly after the march of Eudemos to the assistance of Eumenes. It was followed immediately by the conquest of Gangetic India, Justin xv 4, and in 316 B C, the rule of Chandra Gupta was acknowledged over the whole northern peninsula, from the Indus to the mouth of the Ganges. The authorities differ as to the length of Chandra Gupta's reign, which some make thirty-four years and others only twenty-four. The Mahawanso gives thirty-four years, the Dipawanso and the Vayu Purana give only twenty-four years. This difference may, perhaps, have originated in two distinct reckonings of the date of his accession, the one party counting from the death of Nanda Mahapadma, in B C 325, and the other party from the conquest of India, in B C 315. Some assumption of this kind is clearly necessary to reconcile the different authorities, unless, indeed, we take the only alternative of adopting the one and of rejecting the other. At this period, the capital of India was *Pataliputra*, or *Palibothra*, which was situated on the *Ganges*, at the junction of the *Erranaboas* or *Alaos* River. The former name has already been identified with the Sanskrit *Hiranyabahu*, an epithet which has been applied both to the *Gandak* and to the *Son*. But the latter name can only refer to the *Hsile-an* of the Chinese travellers, which was to the north of the *Ganges*, and was there undoubtedly the *Gandak*. Indeed, this river still joins the *Ganges* immediately opposite to *Patna*—that is, “the city,” or metropolis, as its proper name (*Patna*) implies, the junction of the *Son* is some nine or ten miles above *Patna*. But as there is good reason for believing that the *Son* once joined the *Ganges* at *Bakipur*, or *Bankipur*, immediately above *Patna*, it is quite possible that the *Erranaboas* may have been intended for the *Son*, and the *Alaos* for the *Gandak*. According to Megasthenes, *Palibothra* was eighty *stadia*, or nearly nine miles in length, and fifteen *stadia*, or one mile and two-thirds in breadth. It was surrounded with a deep ditch, and was enclosed by lofty wooden walls, pierced with loopholes for the discharge of arrows (*Arian, Indica x* and *Strabo xv*, both quoting *Megasthenes*). Chevalier Bunsen also mentions (ii 543-4) that Chandragupta was present when Porus was murdered. He says he dethroned and

murdered the younger brother of Nanda king of *Palibothra*, or *Patalipura*, B C 312, and founded the *Maurya* dynasty, whose reigns gave a lustre to the East. Chandragupta's kingdom extended over the Persians, i.e., the Easterns, also the Peninsula of Guzerat, and north to the Indus, and south to the mouths of the *Ganges* and *Telingana*, the whole of *Aiyavarta*. His forces consisted of 600,000 Infantry, 30,000 cavalry, and 900 elephants. Subsequently, towards the close of the fourth century before our era, when Alexander's successors were at peace with each other, the great *Seleucus* turned his arms towards the East, with the intention of recovering the Indian provinces of Alexander, but Chandragupta formed an alliance with *Seleucus*, whose daughter he received in marriage. He also received at his court of *Palibothra*, *Megasthenes*, as an ambassador, and in return, Chandragupta sent presents with an ambassador to *Seleucus* to *Babylon*. The hindu drama of *Mudra Rakshasha* records the memorable political event of his usurpation of *Palibothra*. His name occurs in an inscription at *Sanchi*, also on one at *Ojora*. *Tod* says he was of the *Takshak* race. He died B C 289. His successor died B C 261, and *Asoka*, the great buddhist sovereign, the grandson of Chandragupta, then succeeded. *Asoka* had murdered his brother, whose son converted him to buddhism, was crowned B C 258, at *Patalipura*, in the third year of his reign. *Asoka* engraved on rocks numerous inscriptions inculcating buddhist doctrines, erected, it is said 84,000 *Chaitya*, many of which still remain. *Asoka* reigned 37 years, and immediately afterwards B C 225, the partition and downfall of the kingdom took place. *Ch Bunsen* states the army of *Asoka* at the same numbers as those of Chandragupta—*Bhilsa Topes, Cunningham, p. from 87 to 91 Bunsen Egypt iii 544 Tod Rajasthan Cal Review*. See *Arases, Aratta, Asoka, Bhattya, Buddha, Inscriptions 373, 374, 375, 378, 383, 387, 434, Junaguh, Magadha, Megasthenes, Scylax Shaman, Vindusara*.

CHANDRASENI KAYASTHA, S A caste of writers in Poona, who claim to be descended from a raja named Chandrasena, and therefore claim to be regarded in some degree as Kshatriya, and to be entitled to perform the ceremonies of the Vedas, a claim not recognized by the brahmins. There are two divisions the Patani Prabhu, and the Dawani Prabhu. The former are found at Bombay and other towns, the latter at Goa. It is this caste whom the British call Purvooe Wilson

CHANDRASECHA, the name of a mountain in the N W. Himalaya. See Kali.

CHANDRA VANSA, or Indovansa, lunar race, a race that reigned in Antarveda and Kasi, but afterwards in Magadha (Behar) and Indraprastha (Delhi). In this dynasty are included the kings of Kasi (Benares), the Line of Puru and the Line of Yadu

Ati Muni

Soma - Lunus, the Moon

Buddh Mercury, married Ila, daughter of the Sun.

Alias or Pururavas

Ayu . Kings of Kasi, descended from him

Nahusha Devanahusha, Dionysos, Bacchus (Wd)

Yayati Father of Puru and Yadu

According to Tod, the following are synchronisms of the Solar and Lunar Races

Buddha of the Lunar Race married Ila, the sister of Ikshwaku, s 1 Tod

Harischandra, s 1 contemporary of Parasurama of lunar line

Sagara, cot of Taljanga, of Parasurama

Ambarisha, cot of Gadhi, founded Kanouj

In the line of Pura occurs Hastin, who built Hastinapur, and Vichitravirya.

Indu, Som, Chandra, in Sanscrit mean the moon hence the lunar race is termed the Chandra vansa, or Indu vansa, or Soma-vansa. Tod — *Thomas' Prinsep's Indian Antiquities*. See Magadha, Mysore, Rama Pandu, Surya.

CHANDRAOTA. An ancient town at the foot of the Aravalli mountains. It was anciently the capital of the Pramar rajahs. Its ruins are situated about twelve miles from the foot of the Aboo mountain, on the banks of the Bunass, and in a fine well wooded country. When Ahmed, grandson of Jaka, styled Wajeh-ul-mulk, resolved to found Ahmedabad, he chose a site occupied by a community of the Bhil race, whose predatory

habits were the terror of the neighbourhood, and resolved to create his new capital by means of the city of Chandiaota, the materials of which he used and compelled all its people to follow the spoils of their temples and dwellings to the uninteresting, unhealthy low flat on the banks of the Sabarmatty — *Tod's Travels* p 134. See Kalmuck

CHANDERAWUT, descendants of Chandra, one of the most powerful vassal clans of Mewar. Rampooria (Bhanpoora) was their residence, yielding a revenue of five lacs (£110,000), held on the tenure of service from an original grant from Iana Juggut Sing to his nephew Madhu Sing. Chandra obtained an appanage on the Chumbul — *Tod's Rajasthan, Vol I, p 261*

CHANDRAYANA, a hindu penance which consists in the sinner or devotee "eating for a whole month no more than thrice eighty mouthfuls of wild grains, as he happens to meet with them, keeping his organs in subjection." The reward of this is attaining the same abode as Chandra, the regent of the Moon and it absolves a brahmin from the sin of slaughtering a thousand small animals which have bones, or of boneless animals, enough to fill a cart, and it is also the common penance for killing a Sudra, a hindu of the fourth or servile class — *Coleman, p 92*

CHANDRIE HIND Calonyction Roxburghii

CHANG-CHEN-MO This place gives its name to a route of about 16 marches between Ladak and Eastern Turkistan, said to be the easiest from India to Upper Asia, much easier than the more westerly Kara Korum route traversed by Schlagintweit and Mr Johnson. The heights vary from 19,000 to 21,000 feet, but the mountains are generally rounded, and fuel and grass are abundant save at one stage. Gumah is equi-distant between Ilchn and Yarkund, and the Kara Korum route meets this route at Shadula.

CHANGEABLE ROSE Hibiscus mutabilis

CHANGEZ KHAN, or Jenghiz Khan Temuchin, afterwards known as Chinghiz, was born of a Mongol tribe on the banks of the Oxon in 1162. He conquered and expelled Mahomed the Kharasmian, and defeated her son Jalaluddin, on the banks of the Indus. Aung khan, of the Keraite Mongols, celebrated in Europe under the name of Prester John, was a contemporary of *Changez Khan*, whom, at the instigation of jealous enemies, he attempted but failed to destroy (*Elliot*, p 498). As the result of Temuchin's successes against the nations of Tartary, he was saluted in 1206 by the diet of his nation as Chinghez khan. According to Quatremere, Chinghez did not use the higher appellation of Kaan (or Qaan), which was

adopted by his son Okkodai and his successors as their distinctive title, identical with Khaqan the Xaganos of the Byzantine historians. Properly a distinction should therefore be preserved between Khan, the ordinary title of Tartar chiefs, and which has since spread to Persian gentlemen and in India become a common affix to the name of Mahomedans of all classes, and Qaan, as the peculiar title of the supreme chief of the Mongols. The Mongol princes of the subordinate empires of Chagatai, Persia, and Kipchak, were entitled only to the former affix, though the other is sometimes applied to them in adulation. The conquest of China was commenced by Chinghez, although it was not completed for several generations. Already, in 1205, he had invaded Tangut, a kingdom occupying the extreme north-west of China, and extending beyond Chinese limits in the same direction, held by a dynasty of Tibetan race, which was or had been vassal to the Kin. This invasion was repeated in succeeding years, and in 1211 his attacks extended to the empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chungtu or Peking. In 1219 he turned his arms against Western Asia and conquered all the countries between the Bolor and the Caspian and southward to the Indus, whilst his generals penetrated to Russia, Armenia, and Georgia, but a lieutenant, whom he had left behind him in the East, continued to prosecute the subjection of Northern China. Chinghez himself, on his return from his western conquests, renewed his attack on Tangut, and died in that enterprise 18th August 1227. Okkodai, his son and successor followed up the subjugation of China, extinguished the Kin finally in 1234, and consolidated with his empire all the provinces north of the Great Kiang. After establishing his power over that part of China, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia, and Asia Minor, whilst another great host, under Batu, the nephew of the great Khan, conquered the countries north of Caucasus, overran Russia, making it tributary, and still continued to carry fire and slaughter westward. One great detachment, under a lieutenant of Batu entered Poland, burned Cracow, found Breslaw in ashes and abandoned by its people, and defeated with great slaughter at Wahlstadt near Lignitz (April 12th, 1241) the troops of Poland, Moravia, and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. Batu himself, with the main body of his army, was ravaging Hungary. The king had been very

slack in his preparations, and when eventually, he made a stand against the enemy, his army was defeated with great loss, and he escaped with difficulty. Pesth was now taken and burnt, and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear through Europe, which the defeat at L'gintz raised to a climax. Indeed, weak and disunited Christendom seemed to lie at the foot of the barbarians. The Pope, to be sure, proclaimed a crusade, and wrote circular letters, but the enmity between him and the Emperor Frederic II, was allowed to prevent any co-operation, and neither of them responded by any thing better than words to the earnest calls for help which came from the king of Hungary. No human aid merited thanks when Europe was relieved by hearing that the Tartar host had suddenly retreated eastward. The great Khan, Okkodai, was dead in the depths of Asia, and a courier had come to recall the army from Europe. In 1255 a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaelians or "Assassins" on the south of the Caspian, and then successively against the Khalifs of Baghdad and Syria. The conclusion of this expedition under Hulagu may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor, Kublai, extended indeed largely the frontiers of the Mongol power in China, which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and south-eastern borders, but he ruled effectively only in the eastern regions of the great empire which had now broken up into four,—(1) The immediate Empire of the Great Khan, seated eventually at Keanbalik or Peking, embraced China, Corea, Mongolia, Manchuria, and Tibet, and claims at least over Tunking and countries on the Ava frontier, (2) the Chagatai Khanate, or Middle Empire of the Tartars, with its capital at Almaliuk included the modern Dsungaria, part of Chinese-Turkestan, Transoxiana, and Afghanistan, (3) the Empire of Kipchak, or the Northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai on the Wolga, covered a large part of Russia, the country north of Caucasus, Khwarizm, and a part of the modern Siberia, (4) Persia, with its capital eventually at Tabriz, embraced Georgia, Armenia, Azerbaijan and part of Asia Minor, all Persia, Arabian Irak, and Khorasan.

The conquests of Changez Khan, and of his successor Okkedai Khan, in the first half of

the century, brought into China a vast influx of Onigoor and Toongan immigrants. Atabeg, also Atabak, in ancient Persia, was an officer or prince, ruler of a province. Luristan seems to have been the latest territory so ruled, until Changhez Khan, with his destructive hordes of Tartar and Moghul, overwhelmed the land, spreading fire, slaughter, and pillage in every quarter. Ali Khan, or Hoolakoo Khan, the grandson of Changhez Khan, completed the conquest of Persia, and afterwards subdued and took Bagdad, putting to death the last of the once powerful Khalifa. He also employed his force in extirpating that singular and dangerous set of desperadoes, the Assassins, well-known in the annals of the Crusades—*Yule's Cathay* I, cxviii. See Luristan.

CHANGHAT See Jews.

CHANG-KIA-KEW This pass, from the great wall of China, is in the province of Pe-che-lee, about a hundred miles to the westward of that of Kou-pe keou, by which the embassy of Lord Macartney crossed the wall in 1793, and Sir George Staunton later—*Staunton's Narrative*, p 22.

CHANGLA TEL *Aucklandia costus*, *Falconer*

CHANGLO, a Tibetan race, a branch of the Lhopa of Bootan. The Changlo dialect has a considerable amount of glossarial peculiarity with Tibetan, but in other respects it is entirely Tibetan, softened and slightly changed in phonology. The Changlo dialect is spoken along that portion of the northern frontier of the valley which extends from the Binji Doar to the confines of the Kuriapera Doar, or from about 90° to the 92° of East Long. Neither its northern limit nor the numbers speaking it have been ascertained. The inhabitants of this tract occupy the lesser elevation of the southern Himalaya range, and are generally speaking agricultural. Their physical appearance exhibits a few shades of distinction noticeable between them and the tribes of the Sub-Himalaya. They are smaller, less muscular and the hue of their skin possesses a deep isabelline tint. From the latter circumstance, probably, they derive their appellation, the term Changlo meaning black—*Journal of the Indian Archipelago*, Nos IV and V, April and May 1853, p 192. See India, p 338.

CHANGMA. HIND *Populus balsamifera*, P nigra, also *Salix alba*

CHANG-MAI, a mode of spelling Zimmay of the Laos. It is also spelled Xieng-ma. It is on the Menam river, between 19° and 22° N. See Laos.

CHANGO, a tribe of Hungrung Tartars occupying 378 square miles. See Kunawer.

**CHANGPA**, a semi nomad tribe near the Pangong Tsi pass They dwell in their grazing grounds under huts (galkol) made of the yak's hair The people there call themselves Bot

**CHANG-THANG TRIB** On the northern plains to the north of Ladak, supposed to be the Chatae Scythæ of Ptolemy — *A. Cunningham* See Ladak Shawl goat

**CHANI TEL** *Adenanthera aculeata* *Roxb*

**CHANJAN WALE HIND** *Asparagus Punjabensis*

**CHANK HIND.** A harvest ceremony in several parts of northern India, differing in each province. After the heap of grain on the threshing ground has been raised a foot high, a man, in silence, standing with his face to the north, a winnowing basket in his right hand, his left hand being full of grain, commencing from the south, goes round from east to west, and again to the south, pressing his basket against the bottom of the heap This is repeated, changing hands, and when complete, he joins his hands, bows to the heap and supplicates in a few words, either Paameshar or Anna Deota, as,

'Ann Deota ji,

Sahas goona hajiyce" — *Elliot*

**CHANK**, also Chanka, **HIND** a stamp fixed on a stack or heap of grain It is also called chapa, from chapna to print It is the system of making an article over to the supreme being, common in Africa and the Archipelago, under the term "Taboo" and it is similar to the "Ch'hutoor" of the hindu The chank, an engraved piece of wood, is impressed on a cake of earth It has, as a usual motto, Akibat ba khar bad, "may the end be prosperous," or Eman ki salamati, "safety on your honour," implying confidence on the honour of the persons intrusted — *Elliot*

**CHANK** See Chank shells

**CHANKEE MALAY** Cloves *Caryophyllus aromaticus*

### CHANK SHELLS

Sukk,	DUK	Shenku,	SANS
Konk,	ENG	Sankha,	TAM
Chonch,	"	Sangu,	"
Senkham,	SANS	Senkham,	TEL

These shells are species of the genus *Turbinella* Common Chank shells are fished up by divers in the Gulf of Manaar, on the coast opposite Jaffnapatam in Ceylon, in about two fathoms water, and at Travancore, Tuticoreen, and other places Large fossil beds of chanks have also been found They form a considerable article of trade in India, as they are in extensive demand all over the country They are sawn into narrow rings or bracelets, and are worn as ornaments, for the arms, legs, fingers, &c. by the hindoo women, many of

them are also buried with the bodies of opulent and distinguished persons Those which, from being taken with the mollusc, are called green chanks, are most in demand The white chank, which is the dead shell thrown upon the beach by strong tides, having lost its gloss and consistency, is not worth the freight up to Calcutta. The value of the green chank depends upon its size A chank opening to the right, called in Calcutta the right handed chank, is so highly prized, as sometimes to sell for 400 or 500 or even 1,000 Rupees The Jungum religious mendicants and those of the Veetianroosty caste, blow them as horns The commercial returns show an exportation from Madras of ten to twenty-four lacs of these shells in one year

	No	Value
1852—1853	15,15,495	Rs 51,780
1853—1854	24,60,727	„ 101,481
1854—1855	10,81,575	„ 56,165
1855—1856	{ Not given, supposed 7,50,000 }	26,171
Total	59,10,777	Rs 2,41,597

They are classed as Patty and Pagel, or short and pointed headed, and Wallampory, or right-hand chanks Bertolacci mentions, as a peculiarity observed by the Ceylon fishermen, that all shells found to the northward of a line drawn from a point about midway from Manaar to the opposite coast at India are of the kind called "pitty," and are distinguished by a short flat head, and all those found to the southward of that line are of the kind called "pagel," and are known from having a longer and more pointed head than the former Nor is there even an instance of deviation from this singular law of nature The "Wallampory or 'right-hand chanks' are found of both kinds" Chanks are alluded to in *Cosmos Indicopleustes*, and by Abu Zaid in "Voyages Arabes," showing that so early as the 6th century this shell was fished for The fishery until a few years ago continued a Government royalty They are made into rings, beads, armlets, bracelets, and the Sankasari of Dacca are famed for their skill in working with the chank or sank The pictures and figures of the hindu god Vishnu, always represent him with a chank shell in one hand and a discus or chakra in the other In ancient times, each Indian warrior used the chank as a trumpet — *Rohde MS Ainslie Nat Med p 143 Tennent's Sketches of the Nat Hist. of Ceylon, p 372* See Sankasua Vishnu

**CHANNA HIND** The pulse *Cicer arietinum*, called Bengal gram, gram, and chick pea There are varieties of it, or other pulses receive

similar names Chenna siya is black gram, and Chenna Kabuli, Kabul, or white gram Its principal use is to feed horses and cattle, but the people of N India often eat it An acid forms on the leaf of the channa, a mixture of oxalic and acetic acids, which is used in chemical processes and in the preparation of nitric and muriatic acids Cloths spread on the plant become moistened by the dew, and absorb the acid — *Elliot*

CHANNAN, also Chanuni on the Chenab, &c Populus alba, the white poplar

CHANNEE TAM? A tree of Travancore, wood of a brown colour, used for oil-mills, &c — *Col Frith*

CHANNI HIND Daphne oleoides

CHANNY MARAM TAM? A tree of Travancore wood of a brown colour, used for building common houses — *Col Frith*

CHANNY VENGAI TAM? Travancore, wood of light yellow colour, one to six feet in circumference, used in house building — *Colonel Frith*

CHANOLA-TURAI HIND Luffa, *Species*

CHANOO BENG Apium involueratum, *Roxb*

CHANUN HIND Populus ciliata

CHANUNI. HIND Populus alba, the Ban

CHANOS ARGENTEUS Bloch The milk fish

CHAN-PA, the Tibetan name of Great Tibet It means snow-land See Lhassa

CHANSCHENA MALEAL Bauhinia tomentosa

CHANTABURI, one of the ports of Siam, probably the second in commercial importance It is at the mouth of a river, which, though not long in its course, fertilizes a considerable district by its inundations during the rainy season The rocks at the entrance of Chantaburi present all the appearance of a colossal lion couchant — *Bowring's Siam, Vol I, p 25*

CHANTABURI, which means the nutmeg country, is a range of mountains east of Siam whose defiles are held by the Xong or Ching, who are said to be an offshoot from the Karen The wax sold by the Xong is the produce of wild bees of gigantic size, which build their cells on the top branches of trees at the height of 150 feet

CHAN-YO OR CHAN-YU CHIN Dioscorea batatas

CHANZ, a pass leading from Kashmir to Tibet It is also called Sang-i-Safed.

CHAODA-RATNI, in hindu mythology, fourteen precious articles, called gems, obtained by churning the ocean. The second incarnation of Vishnu was in the form of a tortoise, hence known as the Kurma avatar

The principal incident in it was the churning of the ocean, with the huge mountain Mandara, as a Churn-rod, using the great serpent Sessa as a churning rope, while Vishnu, in the form of a tortoise, sustained the vast load. The produce was the fourteen precious articles (or gems), the chaoda-ratni, or more classically the chatur desa ratna, one of which was medicine, another poison See Vishnu

CHAOLMOOGRA, also Petarcua, HIND. Chaolmoogra odorata

CHAO-ME-DO, also Chao-mo-to, a place lying between the great wall of China on the Kalgam and Selinginsky, in the country south of the Amoor It is signalized as the place where the rebel Koeur-tan (Kal-dan) was finally defeated, A D 1696 Kaldan was uncle to the reigning prince, Tse-vang-Rah-dan, and had stirred up the Eleuth Tartars to rebel See Kalkas

CHAON, a name given to a genus of dogs See Canis

CHAONRI HIND A police station — *Elliot*.

CHAORI This is made of ivory, bone, or shell, and is the most ancient ornament of the Indo Scythic dames. It appears in old sculptures and paintings In a very old Gothic church at Moissac in Languedoc, the porch, attributed to the age of Dagobert, is the only part left Sculptures on it represent the conversion of Clovis Some sculptured figures below, are of a distinct age, of an Asiatic character, showing the scarf, the Champakuli or necklace, representing the buds of the jessamine (champa) and chaori — *Todd Rajasthan, Vol II, p 284* See Chowri

CHAOU SEEN The native name of Corea See Corea

CHAP HIND An impression from a stamp or seal, from the verb Chapna, to stamp or seal The Chinese "chop" is a stamped permit, hence also the Hindi term Chapa-khana, a printing press

CHAH HIND The refuse of the Jhurburee, after the Pala is beaten from it — *Elliot*

CHAPABARRY, in long 89° 1' E, and lat 26° 50' N

CHAPADA, or Chopada SUMATRA Fruit of Artocarpus integrifolia

CHAPANGU MALEAL Cæsalpinia sappan

CHAPAN I-KARD PUSHT A woollen jacket

CHAPAR HIND A thatch of straw, also roofing slate — *Elliot*

CHAPATI. HIND. An unleavened cake baked on a girdle, eaten by the people of Hindustan

CHAPEAUX FR Hats

CHAPEE, a river near Bholtah in Kotah.

CHAPEL ISLAND, called by the Chinese Tung ting-seu, is in lat.  $24^{\circ} 10' N$ , long  $118^{\circ} 13\frac{1}{2}' E$ , on the south-east coast of China—*Horsburgh*

CHAP KA-LAC HIND Sealing wax, properly sealing-lac, as, in India, wax is never so used

CHAPLASHA HIND. Aitocarpus chaplasha

CHAPOO, a town on the coast of China, capture of, 18th May 1842

CHAPAR, a thatch Chapar band, a thatcher

CHAPPAR, in Kangra, a kind of well, yielding iron sand

CHAPPAR, in Beluchistan The valley of Chappar lies westward of Ziafet, and extends from the vicinity of Kelat to that of Mungochar It is therefore of considerable size, it contains the village of Chappai and other small hamlets See Beluchistan Kelat, p 488, 492

CHAPPATI-KI-BHAJI. Duk, Marsilea quadrifolia

CHAPPEES, a river near Benace in Kotah

CHAPRA-LAKH, HIND. See Chap-ka-lac

CHAPRASI HIND A messenger, from Chapras, Hind, brass, because all messengers wear a belt across their shoulders, with a brass badge

CHAPRE, HIND Cow-dung cakes, they are also known by the names of Gobur, Oopla, Gosa, Doja, Thepre and Chot.

CHAPRUNG, in long  $79^{\circ} 33' E$ , and lat  $31^{\circ} 27' N$  It is described as a large populous place When any man of property dies, they bruise the body to pieces, bones and all, and form it into balls, which they give to a large species of kite, who devour them These birds are sacred, kept by the Lamas, and fed by them, or by people appointed for that purpose, who alone approach them others dare not go near them, perhaps from superstitious motives, for they are held in great fear This is a ceremony which is very productive to the priesthood, an expenditure of very large sums (many thousand rupees, said our informants), being made on the decease of any great man, and the Lamas receiving presents of very fine and expensive caps Poorer people are sometimes buried, and at others thrown into the river.—*Fraser's Himalaya Mountains*, p 338.

## CHAPTALIA GOSSYPINA

*Oreocoris lanuginosa*

The plant

Shepherd's tinder, ENG | Sookta

PANJAB

The tinder

Kuff, PANJ | Kuffee,

PANJAB

This is found in the Sutlej valley between Rampur and Sunnam, at an elevation of

7000 to 9000 feet The tomentum or downy filament on the under surface of the leaves is employed by the hill people as tinder *Gleghorn Punjab Report*, p 67 *Beng A S Soc Proceedings*

CHAPTIL-LAC Duk. Guz and Hind. Shell-lac

CHAPARA SIUSHTHEE SANS From chapara, to press, and shash-hee, the name of a goddess

CHAR, also Char-Charoli MAR Buchananania latifolia

CHAR, HIND Valeriana Wallichiana, Valeriana Hardwickii, Quercus semecarpifolia

CHARA HIND Fodder, forage, green gram, wheat or other crop, cut for forage or fodder, also a tuess, a sheaf, grass, food for animals

CHARADRIUS HIATICULA Ringed plover of Europe, N Asia, Japan, Greenland.

CHARADRIUS CANTIANUS Kentish Plover of Europe and Asia, not uncommon in India

CHARADRIUS PHILIPPINUS Ch minor, 'Little Ringed Plover' of Europe, Asia, North America rare in Britain, exceedingly common in India.

CHARADRIUS PYRROTHORAX, a very common Indian species, known in Europe as a straggler

CHARA CHETTU Tril Buchananania latifolia, R n 385 Fruit called Chara pappu, Chara mamidi

CHARAI HIND of Kaghan, Juniperus excelsa, J arbores, Pencil cedar

CHAR AIMAK Aimak is a Mongolian, Mantchu and Turki word, meaning a tribe Of these, there are in Kabul and Persia four tribes, the Char Aimak They dwell to the north of Herat and Kabul in the range of the undulating country which in some places assumes a mountainous, in others a hilly character, and in some parts is well watered, in others bleak and rough, forming a watershed of two natural divisions, from the western of which flows the Muighab, the Tajend and the Farrak-rud, and from the eastern, the Helmund, the south-eastern feeders of the Oxus and the north-western feeders of the Kabul river It is said that Timur, exasperated at the depredations committed by the people inhabiting Mazanderan, south of the Caspian, transported the whole of them into the mountains situated between India and Persia The descendants of that people form the four tribes or Aimak. They are also called Firoz Kobi, after the city of that name (situated about sixty-three miles from Teheran), where they were defeated and taken captives by Timur According to Latham, the Aimak are of the Sunni sect of mahomedans, and are in number four, viz,

the Timuri, the Hazara, the Zuri, and the Timuri. The Timuri and the Hazara lie beyond the boundaries of Kabul, and are subject to Persia. Vambery says that the four tribes are the Timuri, Teimem, Feroz Kohi and Jamshidi, and that the whole are of Iranian origin and speak Persian. The Timuri dwell about Gorian and Kal'san, the Teimem from Kairukh to Sabzwai, the Feroz Kohi near Kale No, and the Jamshidi on the shores of the Muighab. In their reverence for fire, and their respect to the East, to which their tent doors look, they retain many of the fire worshipping views. The Aimak tents are Turk, those of the Timuri are Afghan. They live in well fortified castles, but in tents rather than houses, prefer a despotic government, eat horse flesh, and mix the flour of a nut called Khundzik (chestnut?) with that of their wheat. The Aimak settled in the 13th century and their number is estimated at 400,000 — *Latham's Descriptive Ethnology*, *Ferrier Hist of Afghan*, p 3 *Vambery, Sketches of Central Asia*. See Mongols.

**CHARAITA** DUK Agathotes chirayta, *G Don*. This valuable bitter is largely employed in medicine, being a perfect substitute for the gentian of Europe. Several plants are, however, used under this general name. The *Andrographis* (*Justicia*) *paniculata* is one of the best of these, and the *Ophelia elegans* is another. See Agathotes, *Andrographis*, *Ophelia*, *Chiretta*.

**CHARA KANDA** TEL *Colocasia nymphaefolia*, *Royle*.

**CHARKH**, HIND A wheel.

**CHARAKH PUJAH**, religious rites amongst hindus. When the sun enters Aries hooks from a lever are passed through the skin over the shoulder blade, and the lever is made to rise high in the air and revolve with the hooked person. Wood and iron and snakes are passed through the tongues, the cheeks, and the skin of devotees and of young children. The devotees are called Gajan, and it is in honour of Siva that they inflict tortures on themselves. The British Government about the middle of the 19th century prohibited its practise in British India. See Siva.

**CHARAN**, a sacred race in the west of India, whose character and pursuits almost resemble those of the Bhat or Bards, and the origin of both is involved in fable. In hindu mythology, the Bant or Bhat, the hindu bards, were produced to amuse Parvati, from the drops of sweat on Siva's brow, but they sang the praises of Siva only, which so offended Parvati, that she turned them out of heaven, and condemned them to lead a wandering life upon earth, to sing there the martial deeds

of heroes and the praises of the gods. According to another mythology, Mahadeva created a bard to attend to his lion and his bull, but the bull was daily killed by the lion, on which Mahadeva, tired with daily creating a bull, formed the Charan, to be their attendant. The Charan was equally devout with the Bard, but of bolder spirit, and from that date the bull was never destroyed by the lion. The Charans of the Maroo or desert, in the sandy tract of the Indus, are mendicants who attend at marriages and festivals, and threaten to injure themselves if not relieved. The Charan is generally revered, and follows the profession of a bard, herald, and genealogist, and as such is often taken as personal security, the breach of which is followed by the death of the charan or of some member of his family. In Central India, owing to the pressure for means, they have become grain carriers. A colony of Charans from the frontiers of Cutch Bhooj, was founded at Marlah, near Chittore, by rana Hamir, so celebrated in the history of Mewar, he had a leprous spot on his hand, to remove which he made a pilgrimage to the shrine of Hinglaj, upon the coast of Makran, the division *Orizæ* of Arrian's geography. The Marlah Charans are of the tribe Cucholeah, and are grain carriers. The sanctity of their office made their persons sacred, and the immunity extended likewise to their goods, and saved them from all imposts, so that in process of time they became the free-traders of Rajpootana. This community collectively advanced to receive Colonel Tod at some distance from the town. The procession was headed by the village band, and all the fair Charani, who, as they approached, gracefully waved their scarfs over him. It was a novel and interesting scene. The manly persons of the Charans, clad in the flowing white robe, with the high loose folded turban inclined on one side, from which the mala, or chaplet, was gracefully suspended, the naiques or leaders, with their massive necklaces of gold, with the image of the pitriswur (manes) depending therefrom, gave the whole an air of opulence and dignity. The women were uniformly attired in a skirt of dark brown camlet, having a boddice of light-coloured stuff, with gold ornaments worked into their fine black hair, and all had the favourite Choori, or rings of *hati-dant* (elephant's tooth), covering the arm, from the wrist to the elbow, and even above it. The founders of this little colony accompanied rana Hamir from Guzerat in the early part of his reign, and although five centuries have elapsed, they had not parted with one iota of their nationality or their privileges since that period:

neither in person, manners, or dress, had they any thing analogous to those amidst whom they dwell. Indeed, their air is altogether foreign to India, and although they have attained a high place amongst the tribes of India, their affinity to the ancient Persian is striking, the loose robe, high turban, and flowing beard, being more akin to the figures on the temples of the Guebres than to anything appertaining to the Char-burjun or four classes of the Hindus — *Rajasthan, Vol. II, p. 622*. See Bair, Bhat, Kutch, India, p. 334, Rajput.

CHARAN DASI, a sect of Vishnavahindus who worship Krishna and Radha. It was founded by Charan Das, who lived in the reign of the second Ahmgh, and was a merchant of the Dhusar tribe, a resident of Delhi. His followers are both clerical and secular. At Delhi, is the Samadh or monument of the founder — *Wilson*. See Hindoo.

In the south and south east of Asia, where coal is found only in a few localities and the cost of carriage is great, charcoals are in great request, and attention to the modes of preparing them is of much consequence. In the peninsula of India, the common native mode is to set on fire a heap of small wood and, after allowing it to burn for some time, to quench it either by water or by heaping earth upon it, but charcoal so prepared is of little value in reducing iron ore, and the process is wasteful. In various parts of the country, there are slight differences in the mode of preparation, but all are faulty and objectionable in an economical point of view. It is therefore of great importance to India that more economical modes of preparing charcoal should come into general use, the destruction of fuelwood in the neighbourhood of iron works being grossly extravagant. Indeed, between the loss in preparing the charcoal and the loss of heat in preparing the iron, the consumption of the fuel is probably, at least, ten times as great as it ought to be, inducing great loss and in many cases rendering useless extensive beds of most valuable ore. Native iron smelters only employ fuel from one to three inches in diameter, and, to procure this, they take saplings, or the tops and branches of the largest hard wood trees, allowing the trunks to decay. They do this because large trees are not adapted for fuel for native smelting, as the cost of splitting them adds greatly to the expense, and, unless the logs be split, the inner wood is not carbonised. Charcoal, to be good, should be of wood burned with as little exposure to the action of the air as possible and be black, brittle, easily pulverised, perfectly insipid, solid, and inodorous. Charcoal is mostly used as a fuel, and in the manufacture of gunpowder. For the forge, the best is that prepared from bamboos and from stems of palmyra leaves (Tel. Tati komaloo). The tamarind yields a good charcoal for the same purpose as do most hard woods. But the charcoal of the Acacia sundra is said to be amongst the best for this purpose. For gunpowder the root of the milk hedge, Euphorbia nerifolia, and of the Calotropis gigantea is preferred. At the Madras Government Powder Mills, that of the gram bush, Dolichos uniflorus, and, in those of Bengal and Bombay, the Cajanus indicus or pigeon pea stalks are used. Charcoal used for gunpowder manufacture is generally made from small shrubs or herbs, as Vitea, Cajanus, the mudar, Calotropis gigantea and Parkinsonia aculeata, the Parkinsonia being said to yield a very good charcoal for gunpowder, though the gunpowder considered

the best is manufactured from the *Sesbania Egyptica*. The gunpowder charcoal used at the Damoodah Coal Works is made from an *Acacia* the Sikhs employed *Justicia adhatoda*, which is also in use all over India at Aden the Arabs prefer the *Calotropis*, probably, because it is most easily procured. The grain of all these plants is open, whereas in England, closer-grained and more woody trees, especially willows, are preferred. In India, gunpowder charcoal is also made from the *Adhatoda vasica*, *Alnus*, *Butea frondosa*, *Colebrookia oppositifolia*, *Cornus macrophylla*, *Daphne olcoides*, and *Hamiltania suaveolens*. In Ceylon, the cashew-nut tree is considered the best sort of wood for charcoal for iron smiths, and is felled for this purpose only. With this, as a substitute for coals, the assistance of a sheep skin for bellows, and a hole in the ground for a forge, the native smiths produce any piece of iron-work, iron knees and channel-work for large vessels, and the brass founder, any piece of metal, such as the pintles and braces for ships of 700 tons burden. At Darjeeling that of the chestnut wood is used by blacksmiths. In Nepaul, the best is made of the wood of the Bahang, or holly leaved oak. In Kullu and Kangra the wood chiefly used for charcoal is Kail, *Pinus excelsa*, but the alder (kaunch) the *Alnus Nepalensis*, which fringes the tributary streams, is also employed for this purpose, as no hard woods are available. The lighter woods generally yield lighter and more combustible charcoals. Nevertheless, the dogwood of Britain, the wild Cornel tree, which makes the strongest of the British gunpowders and is exclusively used for the powder of the breech loading fire arms, is a dense, comparatively heavy, slow growing wood. In Britain, the alder, the willow, and dogwood, are the only woods used for charcoal in the Government establishments, the two former for cannon powder, the last for small arms. Private makers use the same woods, and the last for the forest sporting powder. The three woods grow well in England, but they are chiefly obtained from Belgium, Holland and Sussex, the dogwood selling at £12 to £15 the ton, coarser woods are used for common blasting powder. There are many circumstances connected with this ingredient of gunpowder not yet understood, but it seems to be the variations in it which cause the differences in the powder. Charcoal is little liable to decay. When the building of Fort William was completed, about the middle of the eighteenth century, it was resolved to lay in a store of fuel in case of siege, and with this view an enormous quantity of charcoal was buried in large square beds in the centre of the barrack

squares, these beds being about four feet in depth, and about the same distance beneath the surface of the ground. About eighty years afterwards, these charcoal deposits were opened, and although it appears that, from the nature of the soil, the fuel has been saturated with water for more than three-quarters of a century, its value and its powers of combustion seem to be scarcely, if at all, impaired. The best charcoal for a dentifrice, is that of the betel-nut. Charcoal possesses remarkable antiseptic properties, as it resists the putrefaction of animal matter, and destroys the smell and colour of many substances — *M. Faullner*, *M. Rohde*, *D. Cleghorn*, *McCulloch's Diet*, p 266, *M. Wall's Report in G O 17th July, No 1040 of 1859*, *Hooker's Himal Jour Vol 1, page 9* *Edye Mal and Can. D. J L Stewart Quarterly Review, July 1868*

CHAR-DANGHEH, in Persia, a mode of dividing fields. See Dangrah

CHAR DEH, the town of Kabul is built at the foot of a hill of gneiss that rises 1000 feet above it. The town bends round it from the south-east to the south-west, where, with the dip of another hill opposite, is formed the pass, 150 yards broad, that leads into Char-Deh. Kabul may be described as lying at the foot of a range of hills whose direction is from north east to south-west. The country is thus divided into the plain of Kabul, and the Char Deh or four villages. See Kabul, p 433

CHARIKAR, a town in long 68° 59' E and lat 34° 28' N. It is near Bagram, and thirty miles north of Kabul. From Charikar to Jellalabad the road is open, and it is supposed that Alexander, whether he recrossed the mountains at Bamian or at Beghrum, marched by this route on India. See Kohistan

CHARIKONA SHIM BENG Goa Bean. *Psophocarpus* or *Dolichos tetragonolobus*

CHARI-MARAM, the wood called ebony in England named Acha-marm, Nuga gaha SINGH — *Edye, Mal. and Can*. See Ceylon woods

CHARIOT The war chariot is mentioned in Judges 19, where we are told that Sisera

had nine hundred chariots of iron. From the Sanscrit work, called the Dhunoo-veda, it appears that the hindoos had war chariots, similar to those of Siseia. They are described as having had many wheels, and to have contained a number of rooms. The war chariot is peculiar to the Indo-Scythic nations, and was in use in India from the days of Desaratha and the heroes of the Mahabharat, to the conquest of the hindus by the mahomedans, when it was laid aside. On the plains of Coorukhetta, Cishna became charioteer to his friend Arjuna. Indeed the title Desaratha means a charioteer. The Getic hordes of the Jaxartes, when they aided Xerxes in Greece and Darius on the plains of Arbela, had their chief strength in the war chariot. The war-chariot continued to be used later in the south-west of India than elsewhere, and the Catti, Comani, Comari, of Samasutra have, to recent times, retained their Scythic habits, as their monumental stones testify, expressing their being slain from their cars — *Tod's Rajasthan*. See Hindoo.

CHARITRA. See Komarpal.

CHARIZM, according to Dow, in the 6th century of the Hijrah, a Chazarman empire rose on the ruins of the Seljukidae, which extended itself over Tartary and the greatest part of the Persian provinces. During the reign of Mahomed, Chengiz Khan over-ran the Charizman empire — *Dow's Hindostan*. See Kharism.

CHARJ BENG. Otis Bengalensis.

CHAR-JATTI. HIND. The four clans of the first class of the Khutri. These four are the Seth, Marhota, Khuuna, and Kuppooi. See Khutri.

CHARKARI MAHAL, in the Panjab, the portion of a doab requiring well irrigation.

CHARKA. HIND. Letsæa, *Sp*.

CHARKH. HIND. A pulley over which a water-rope runs, a wheel. The sheave of a block.

CHARKHA. HIND. A wheel, a cotton cleaning wheel.

CHAR-KHANEH. HIND. Chequered muslin.

CHARKHI. A kind of silk of Kabul.

CHARKH PUJA. HIND. A barbarous ordeal among the lower classes and low castes of hindoos of India. By self-inflicted wounds, or being suspended in the air by hooks passed through the back, individuals hope to expiate their sins. See Charakh-puja.

CHARKINA. MALLAL. Boerhavia diffusa.

CHARKHRE. HIND. Carpinus nymphaea.

CHAR-KUCHOO, BENG. Colocasia anti-quorum.

CHARLANG. A section of the Bakhtiari tribes.

CHARLOMBI, the Tamil name of a Ceylon tree which grows to about fifty feet high, and twenty inches in diameter. It is very close-grained and light, and resembles some kinds of mahogany. It is used in house-work, &c. the fruit which it produces is of little value — *Edye, Ceylon*.

CHARLWOODIA AUSTRALIS, the Norfolk Island Breadfruit, attains twenty feet in height, it branches from within a few feet of the ground, and forms several heads, with flag-like leaves, and long-branched spikes of greenish star flowers succeeded by whitish or bluish purple berries, that are eaten by parrots. — *Keppel's Ind Arch, Vol II, p 284*.

CHARMA, a name of Ham, the eldest son of Noah. See Kush or Cush.

CHAR MAGHIZ HIND. Juglans regia. The walnut, lit "the four kernel'd fruit," Pers.

CHARMAK, properly Char aimak. In the Derajat, are warlike Baluch and Afghan tribes, the most unyielding of whom are the Waziri, who continued to resist the efforts made by the British to restrain their incursions on the plains. Still further north and west are the numerous tribes of Afghanistan, of whom may be mentioned the powerful Durani race and the Tajik tribes. The Mongol of Kabul, Persia and Herat, called Kalmuk in Herat and Afghanistan, and Ennak and Char-mak in the Hazara, dwell north of Kabul and Herat. In the Bunnu valley, there are mixed races, and we may notice the Dardu in Gilgit and Chulas. See Char Aimak.

CHARMING DENDROBIUM. Dendrobium formosum.

CHARMO, also Chumra. Guz. HIND. Leather.

CHARMS. ENG.

Tawiz, AR. HIND. PLS. | Ism, HIND. PLS.  
Mantram, SANS. |

Charms are in general use amongst all the races in the south and east of Asia, and amulets are worn and used both to work for good and to work for evil. Dr Milner reminds us that the custom of inscribing mystic characters upon the person, as a safeguard, or having them engraved in the form of an amulet or charm, is of the most remote antiquity. The first mention made of a practice of this kind, is in the case of Cam, who had a mark set upon him, which, whatever was its nature, denoted the bearer to be placed under the immediate protection of heaven, so that no man might slay him. Of a similar nature was the blood sprinkled on the door-posts of Israel in Egypt, a sign that the destroying angel was not to enter, the inmates being under the divine protection. A similar preserving token is referred to in Ezekiel

ix 4, where the man "clothed in linen," having a writing ink horn by his side, is commanded by God to set a "mark" upon the foreheads of those who grieved for the abominations of Jerusalem. "Behold my sign" says Job xxxi 35, according to the marginal reading, or, "Behold, here is my Thau" (a mystic mark), as Calmet renders it, evidently referring to some distinctive badge which he wore, and Paul, probably, alluding to some acknowledged sacred sign, observes, "henceforth let no man trouble me, for I bear in my body the marks of the Lord Jesus" Portions of St John's Gospel were worn by the early Christians, and verses of scripture were even placed upon horses. Among the Anglo Saxons, gems were much esteemed. King John had a large collection, and, in the sixteenth century, amulets were warehoused in large quantities, and usually worn round the neck, as a protection from pestilence, as the following item shows "a hundred weight of amulets for the neke, xxx<sup>s</sup> iii<sup>d</sup>" (*Gage's Hengrave*, 155) The celebrated Nostradamus gives the following extract from a MS poem on the virtues of gems, written by Pierre de Boniface in the fourteenth century "The diamond renders a man invincible, the agate of India or Crete, eloquent and prudent, the amethyst resists intoxication, the cornelian appeases anger, the hyacinth provokes sleep" (*Milner's Seven Churches of Asia*, p 127) The hindu aryan and non aryan races use them very largely There are six descriptions of *charms*, or "muntras" known in Goozerat, which are described in a series of works forming the scriptures on the subject, or "Muntia Shastia" A charm called "Marun Muntra" has the power of taking away life, "Mohun Muntra" produces ocular or auricular illusions, "Sthumbhun Muntra" stops what is in motion, "Akurshun Muntra" calls or makes present anything, "Wusheekurun Muntra" has the power of enthralling, and "Oochatun Muntra" of causing bodily injury short of death (*Ras, Mala, Hindoo Annals*, Vol 11, p 403) Many of the charms worn by hindoos and mahomedans are merely to distract or avert the evil eye A not unfrequent one, in sickness is a string formed of hair that has been combed out of the head, to which is attached a piece of the Acorus calamus root, a cowrie shell, a marking nut, and the eye of a peacock's feather All mahomedans have faith in charms In the *Ellah Namah* (Section 12), an old Persian work, it is mentioned that women, during parturition, derive considerable benefit from wearing a charm composed of certain ingredients made into a little ball, which must be "perforated with a hog's bristle" (*Ouseley's Travels*, Vol. I., p. 227) Most of the maho-

medan pilgrims when moving towards Mecca have a charm or "tawiz" suspended around their necks, and almost all mahomedans when setting out on a journey, bind a piece of money on their arm, as a votive offering to the Imam Zamin In Arabia, the instant a foal is born, a charm is tied round its neck in a bag of black cloth, and sometimes in this the pedigree is placed Many of the mahomedans of Turkey and Asia, carry talismans about with them, especially in war, consisting of verses of the Koran, to which they attach extraordinary influence, and with one mahomedan soldier, who had fallen in battle, a whole Koran was found wrapped in the rolls of his turban The mahomedans put up charms over the lintels of the doors, on the walls of their houses, and almost constantly use them on their arms as amulets, for the cure of ailments, to cast out devils, to ward off demons, fairies, enchanters, and to cleanse a haunted house In exorcism, certain names (Ism, sing Isma, pl) are used by mahomedans, the ism-jallali, or fiery or terrible attribute is used, also, the ism jamali, the watery or an attribute, and with these they cast out devils, and command the presence of good and demons Amongst mahomedan women love-philters are in frequent use, and engraved amulets and leaves and roots of plants, are worn by them to retain or win affection. The Revd Mr Ward once saw a mahomedan woman dropping slips of paper into the river, and upon inquiry, found that they contained some sacred words, and that the woman was presenting these papers to the river saint, Khaja Khizr, in hopes of obtaining relief. Persians consider the number "thirteen" so unlucky, that, in general, they will not even name it When they have occasion to allude to this number instead of mentioning sezdah (*thirteen*), they say Ziyad (much more) or hech (nothing) *Skinner's Overland Journ* Vol 11, p 70 *Ward's View of the Hindoos*, Vol. 11, p 71. *Milner's Seven Churches of Asia*, *Herklot's Kanoon-i-Islam*

CHAR-MUGHZ PERS also Girdighan. Jouz-i-roomi PERS Juglans regia, Walnuts

CHARON Rajpoot priests See Charan

CHARPAI HIND a sleeping cot or bedstead, literally, four foot

CHARRAS, the gum resin of the hemp plant, Cannabis sativa It is collected in Nepaul, but that of Bokhara is most esteemed It is a gum resin, exuding from the flower heads of the hemp plant and also from the seed when ripe In the Punjab, when the seed is gathered, the heads are rubbed with the hands, and the charras collected In other places, men, clothed with leather garments, walk about among the hemp plants brushing up against them. The gum resin

comes off and adheres to the leathers which are then taken off and carefully scraped. The finest charas is produced in Yarkand and Kashgar. There is a kind of charas called "gaida" which is much in use, and of this again there are three sorts, "smkh", "bhangra" and "khak."—*Powell's Handbook*, p 93 *Elliot*

CHARSA, of Ptolemy, the modern Kais, see Kais

CHARSA, a huge bucket made of hide, for a well. See Lao charsa

CHARSUDDA. A town in the Peshawar valley near which the Swat river joins the Kabul river. See Khyber, p 509

CHARTA. LAT. Paper

CHARU, the Malayala name of a jungle wood which grows to about forty feet high, and two feet in diameter. It is used in building native vessels, particularly for planks. It is not very durable, and is of little value except for those purposes. It is cheap, and is easily procured from the banks of the rivers.—*Edye, M and C*

CHARU, HIND. A cake of rice. See Yug

CHARU, in hinduism, one of the five Jagana, who consist of the Bali, Charu, Basvadeva, and Agnihotra. See Inscriptions, p 389

CHARUKAR, a town in Affghanistan. It was plundered and burned on the 3rd October 1842

CHARUL, also Churong. HIND. Charu Mamida. TEL. Buchanania latifolia

CHARULI. HIND. Churongia sapida

CHARUM. MAL. Soda

CHARUNG, a pass in the Himalaya in Lat 31° 24', lon 78° 35'. The Crest of the pass is 17,348 feet. The pass is extremely difficult. See Kunawar

CHARVADAR, in Persia the chief muleteer of a caravan, and generally owner of the animals. He employs a certain number of the Ratirchi or mule drivers as his servants or assistants

CHARWAHA. A herdsman, a grazier, of North India

CHARVAKA. One of the six atheistic systems of philosophy, current amongst the eastern Aryan race in India. The other five are the Yogachara, Sidhanta, Wai-bashika, Madhyamika and Digambara, all full of indeterminate phrases and containing a jumble of atheism and ethics. The derivation of charu-

vaka is from charoo, insinuating, and vaka, a word. See Vidya

CHAR-YARI. HIND. Char, four, and yar, a friend, a sunni mahomedan who acknowledges Abu-Baker, Omar, Osman and Ali as the four legitimate khalifs.

CHASA, also Apaynum. SANS. Opium. Chasa is said to be derived from khas khis, poppy seed

CHASARFO, a yellow earth of Spiti

CHASM. HIND. PERS. The eye, pronounced echasm. It is deemed amongst eastern mahomedans an organ of the body by which they can swear, possibly originating in the old practice of blinding persons. The persian expressions, "Ba chasm," and "Ba sar-o-chasm," also the hindi words "mere an aur ankhi par," meaning your order be on my eyes are usual responses on receipt of an order, and acknowledging that it will be obeyed, on the penalty of the head and eyes. The evil eye is the chasm-i-bad or bad chasm of the mahomedans of Persia and India. See Evil Eye

CHASHMAL. HIND. Amber

CHATEE -- ? Corchorus olitorius

CHATERNI. HIND. Rhamnus purpureus

CHATGARI, a frontier district of British India, situated between Desh Durring and the Bhutan Hills, occupied by the Kachari or Borro of whom about 30,000 dwell in the valley. They are found in the Assam valley, and on its North and South borders, they have no written character, but a large part of

their vocables are identical with those of the Gairi, and almost all the rest may be traced to some dialect of the Tibetan. See India, 338

CHATIN BENG *Alstonia scholaris*

CHATNAH, a town in Manbhoom

CHATNEY, Chutney or Chetney, a warm condiment in use in India

CHATRI GUZ HIND An umbrella. In the native states of India the sovereigns grant the right to wear the Chatri, sometimes designating the colour, similar grants are made for the palanquin, shawls, &c

CHATOORBHOOGAH, the 'four-armed' divinity, a name of Vishnu. In a deed of conveyance by maharao Sri Jey Singh, this deity is invoked. The deed runs thus, At this time, Brother Maun Sing, I bestow upon thee, of my own free will, the village and lands of Jaetpoorah. This donative shall not look to rankroos (physical infirmity,) su-poot (worthiness) or poot (unworthiness) you issue shall enjoy them. Of this intention, I call the four armed divinity (Chatoorbhoog) as witness. You are my own child (chooroo) wherever and whenever I order, you will do my service. If you fail, the fault be on your own head."—*Tod's Rajasthan* 1 610

CHATRA HIND *Leucis cephalotes*

CHATRANGA, the game of chess, so called from imitating the formation of an army. The 'four,' chatur, 'bodied,' anga, array, of elephants, chariots, horse, and foot. See Chatrang Chess, Shatranj.

CHATR GO-PUTR HIND The Kayastha or Kaet race, in the peninsula of India, claim this person as their ancestor. They say he was the secretary to Yama, the god of the infernal regions.

CHATRIWAL HIND *Euphorbia helioscopia*

CHATRIYA Amongst the Aryan Hindus, a warrior branch of their body, taking social rank after the Brahmins. Minu says, "to defend the people, to give alms, to sacrifice, to read the Vedas, to shun the alluements of sexual gratification, such are in a few words the duties of a Chatrya." How this soldier race broke up is extremely obscure, but it is generally supposed that none of the races now in India can trace their lineage to this tribe of Aryans, though some of the Rajpoot families doubtless belong to them. Their quarrels amongst themselves led to their own destruction. There seem to have been two branches, the Solar, who traced up to Ikshwaku, and the Lunar, who traced up to Budha, and Budha married Elli, daughter of Ikshwaku. These soldier Aryans do not appear to have adopted Brahminism readily, and the Brahmins, to overawe them, consecrated by fire on Mount

Abou a warrior body who still remain, and are known as the four agnauia Rajpoot tribes. A not unusual spelling of the word is Kshatriya, but Chetriya is not uncommon. The third Upa Veda which was composed by Viswamitra treats on the fabrication and use of arms and implements handled in war by the Chatrya tribe. See Vidya.

CHATTRI HIND *Agaveus campestris*

CHATU—? Gummy.

CHATUR-DASI, in Hindu astronomy, the 14th day of the Lunar Paesha

CHATUR-DASI In the Hindu religion, festivals held on the 13th and 14th of the month Chait, in honour of Cama, the god of love. *Madana*, he who intoxicates with desire (*cama*), are both epithets of the god of love. The festivals on the 13th and 14th are called *Madana triodasi* (thirteenth) and *chaturdasi* (fourteenth). On these days, the Rajpoots of Oodiyapur sing hymns handed down by the bards, 'Hail! god of the flowery bow, hail! warrior with a fish on thy banner, hail! powerful divinity, who causeth the firmness of the sage to forsake him. Glory to Madana, to Cama, the god of gods, to him by whom Brahma, Vishnu, Siva, and Indra, are filled with emotions of rapture. There is no city in the East where the adorations of the sex to Cama deva, are more fervent than in Oodiyapur, the city of the rising sun.—*Tod's Rajasthan, Vol I, p 577*

CHATUR-DESA-RATNA In Hindu mythology, the fourteen articles called gems, produced by the churning of the ocean. This event is fabled to have occurred in the second incarnation or avatar of Vishnu in the form of a tortoise or Khirina, when the ocean was churned by means of the mountain, Mandara, the serpent Sesha being employed to whirl the mountain round.

CHATUR-MASTA SANS. Sacrifices by the Vaishnava sect, of these there are four kinds, *Vaiswadeva*, *Varuna prayaga*, *Sa imedha*, *Sunastriya*, to be offered up in the months of Ashvini, Kartik and Purnima. The attributes of sacrifice are roasted cakes of flour, with figures of sheep made of flour to *Vishwadeva* and *Varuna*, with vegetables to *Agni* and *Indra* — *Hickes*

**CHATURVEDI** SANSK Meaning a brahmin who has studied the four vedas. It is usually pronounced "Chanbi." Professor Wilson says that the term is now applied to a class of brahmins who are not always of a literary character. In the upper provinces of India they are usually boxers, wrestlers, and the like — *Wilson*.

Takennoe	BURM	Petarcura	HIND
Chaulmugra	HIND		

This tree is a native of Sylhet, but there are a few trees about Rangoon, and it is also met with on the banks of streams in the Tonghoo forests, though it must be considered scarce. In the Sylhet district, it grows to a large size, equalling the large size mango tree. When full grown it may be compared to the great maple, or sycamore *Acer pseudo-platanus*. It blossoms in April and May, and the seed ripens at the close of the year, when the fruit is gathered, the seed is carefully

taken out, dried, and sold to the native dealers in drugs, at about five rupees the maund of eighty-four pounds. Its seeds are medicinal, being beaten up with ghee into a soft mass and applied three times a day to cutaneous diseases. They yield ten per cent of oil by expression, and it has been similarly used. The seeds have been recommended for tape worm, and an ointment, prepared from the seeds, is a favourite application among native practitioners for the treatment of several cutaneous diseases, especially herpes and tinea. The expressed oil is prized as an external application to leprosy sores, while a 6 gr pill of the seed is given internally twice a day. Occasionally the oil is given internally, 5 or 6 drops for a dose. Its wood is adapted for fancy work and cabinet making. — *Roxb Fl Ind m*, 836. *Ed New Phil Mag* No 6 of 1856. *O'Shaughnessy, Beng Phar*, p 382, D. *McClelland, Ho rbeiger*.

**CHAU-MO**, a secretary of the province of Kwang-tung. See *Kwang-tung-chn*.

**CHAUNA**, the name of a wood which grows in Malabar. It resembles the English beech, and is used by the natives for house-work. It is not durable, nor is it remarkable for its growth, quality, or uses — *Edye, M. and C*.

**CHAUUNI** HIND Cleome pentaphylla

**CHAUNSH** HIND *Bechemia*, *Sp*

**CHAUPAN PAL**, or Pahal, of Kashmir, shepherds who tend the flocks of other people.

**CHAUURANÆI SCYTHÆ**, of Ptolemy, are supposed to be the people of Khor, a territory south east of Ladak and eastward of the Byltæ.

**CHAU RAPUPPOO** HIND

Chaul, also Chironji, HIND

This is the seed of the *Buchanania latifolia*, removed from the small stone or kernel of the "achhar" or fruit. It is brought to Ajmeer from Kotli and to Madras from Cuddapah, the seed is very palatable and nutritious, especially when roasted, is used also in medicine, and considered heating, one seer and a half costs a rupee. The fresh fruit is very agreeable — *Gen Med Top*, page 131.

**CHAVALAPURI KADA TLL** *Andrographis echinoides*, *Nees W Ic*

**CHAWURA**, or **CHAURA**. A tribe once renowned in the history of India, though its name is now scarcely known, or only retained in the chronicles of the bard. Of its origin, says Col Tod, we are in ignorance. It belongs neither to the Solai nor Lunar races. The capital of the Chawura was the insular Deobunder, on the coast of Saurashtra, and the celebrated temple of Somnath, with many others on that coast, dedicated to Balnath, or the sun, is attributed to the tribe of the Saura

or worshippers of the sun The Baliabi princes were succeeded in the rule of Guzerat by the Chauva, who finally established their capital in A. D. 746, at Anhalwara, now Pattan, and became one of the greatest dynasties of India. The last raja dying in A. D. 931 without male issue, was succeeded by his son-in-law as prince of the Rajput tribe of Salonka, or Chalukya, whose family were chiefs of Calian in the Deckan, above the ghats. From the comparative nearness of Calian in the Concan, Colonel Tod has been led to suppose the Salonka prince to have come from thence, but further information is unfavourable to that opinion *Elphinstone's History of India, Vol 1, p 401, Tod's Rajasthan, Vol 1. p 101*

This is the root of a small biennial weed, the *Oldenlandia umbellata*, which is largely used as a scarlet dye. It is extensively cultivated in Ceylon and the Peninsula of India, but grows wild and the Singhalese prefer the wild plant. At the Madras Exhibition of 1855 specimens were exhibited from Guntoor, Masulipatam, Nellore, Tanjore, Tinnevely, Travancore, and Madura. The plant grows in light sandy ground near the sea where its roots strike very deep—the colouring matter resides entirely in the bark of the root, the inner portion is white and useless. This root is of great importance to the Indian dyer, yielding a red dye similar to munjeet, *Rubia cordifolia*. The celebrated red turbans of Madura are dyed with the Chayroot. That of Madura is considered superior of its kind, but this superiority is probably owing to some chemical effect which the water of the Vigay River has upon it, and not to any peculiar excellence of the dye itself. Wild chay roots are shorter, and are considered to yield one-third or one-fourth more colouring matter than the cultivated root,

this probably arises from too much watering, as much rain injures the quality of the root. Roots of two years growth are preferred when procurable. It is said that chay-root rapidly deteriorates by being kept in the hold of a ship, or indeed, in any dark place.—*M E J R* When cultivated, the minute seeds are gathered together with the surface sand and sown in land previously prepared. It is watered, for a year, and then dug and sells at Rupees 20 the candy of lbs 500. If left longer in the ground it increases in value and does not require further watching.

When first sown, it is immediately watered with water in which cow-dung has been dissolved. This binds the surface and prevents the seeds being blown about by the winds. The people in the peninsula of India test the value of the root by mixing some of the pounded root and quick lime if good, the mixture soon assumes a fine red colour, if the mixture become pale or brown or if no change of colour take place, it is considered of no value. If a white colour prevail in the inside of the bark, and on the wood we may be pretty certain that the root is spoiled, a green colour is a sure indication of its goodness.—*Rhode MSS* The outer bark of the roots furnishes the coloring matter for the durable red for which the climates of India are famous. Chay-root forms a considerable article of export from Ceylon. It grows spontaneously on light, dry, sandy ground on the sea coast, the cultivated roots are slender, with a few lateral fibres, and from one to two feet long. The dye is said to have been tried in Europe, but not with very advantageous effect. Dr Bancroft suspects it may be injured by the long voyage, but he adds that it cannot produce any effect which may not be more cheaply obtained from madder. This red dye, similar to murex, is used to a great extent in the southern parts of India by the native dyers. It is not held in very great estimation in Europe, but seems to deserve a better reputation than it at present possesses. Attention was drawn to it as a dye stuff in 1798, by a special minute of the Board of Trade recommending its importation, but Dr Bancroft's report discouraged its further importation.—*Rhode M E J R Simmonds* See Dyes.

CH'HAE, or CHHAI, HIND A pad, to prevent laden bullocks from being galled.

CH'HAGUL PUTPUTEE BENG *Euphorbia dracunculoides*

CH'HIAJ HIND A basket used in winnowing grain.

CH'HAKRA HIND A cart or carriage, without sides used for conveying cotton. The "Gari" has sides.—*Elliot*

CH'HAP HIND A stamp, a seal, in north India, the Potdar's stamp. The Chinese Chop. In Delhi and the Upper Doab, it is the name applied to a small bundle or heap of thorns about a foot high. When large, it is called *K heva g r Elliot*

CH'HAPPAR HIND Thatch or a thatched roof, Ch'happar-Band, a thatcher.

CH'HATAK HIND From che, *च*, and tika, mark. An Indian weight and measure.

CH'HATHAR, in L 81° 15' E, and L 28° 30' N

CH'HATIN BENG *Alstonia scholaris*

CH'HATRA, also Chhatra, HIND, an umbrella, a parasol, a small ornamental pavilion.—*Elliot*

CH'HATRAPA, in Bictro Pali, a Satrap.

CH'HATRI, H a man of the second or military caste of Hindus. *H's* See Chatriya.

CH'AIPO, HIND a canopy of royalty.

CHHUITOOR, also Chhattur, HIND the name given in Northern India to a covering placed on a heap of winnowed corn. It is from the Hindoo ch hatra, an umbrella, Persian chutr. It is known also by the names of Berhawn and chank, *q v*. In Benares it is generally a mere cake of cow-dung, elsewhere, it is a shoot of grass, or a dry stick of the arhu, *Cytisus cajan*, with several (generally five) projecting twigs, on each of which a small piece of cow-dung is placed, or a flower of the Ak or Mudar (*Calotropis gigantea*). Sometimes a spear is stuck in the ground, at the side of the heap, and sometimes an artificial flower is placed at a short distance from the bottom of the heap. The object in view is to prevent the effect of an evil eye, or the injury which is sure to be sustained from the praises of any casual visitor, or any "eye biter," as an Irishman would say. That this strange opinion was entertained among the ancients is known to every reader of Virgil and Theocritus. It is a prevalent opinion not only among the Scotch and Irish, but with almost every other nation of the globe. But by the native of N India the Chnutoor is devoutly believed to offer a sure safe-guard against the disastrous effects of fascination. If his Ras or heap be but provided with this protection, the husbandman may sleep secure, but as sure as he neglects it, should an evil

eye fall upon the grain, he will have to weep over the lost hopes of a year's labours

CHHAYA BENG *Ælva lanata*

CHHAYA, spelt in a variety of ways in European books which treat of hindu astronomy, under this term are a variety of elements, but these are multiplied by mistake in consequence of Europeans varying their manner of writing oriental words. The word means a shadow. In hindu astronomy, Vishva chhaya, the shadow of a Gnomon, when the sun is in the Equinoctial points. Madhyama ch'haya, the midday shadow of the same at any other time of the year. Sama mandala ch'haya, the midday shadow of the same when the sun is east or west of the Gnomon, Ch'haya suta, one of the names of Saturn, meaning Born from Darkness.

CH'HAYA HIND A shade, a spirit. The shade of a goddess or deity. In the hysterical or cataleptic seizures which happen to hindu devotees, where a deity is supposed to take possession, the expression used to denote it, is "Ch'haya aya or Saya aya," and the body of the possessed is said to be filled "ang-bhara"

CH'HEDA, also Chheda HIND A destructive little animal similar to the weevil (*Calandra granaria*), from "Chhed," Hind, a hole, the verbal root of chhedna, to pierce. It is also the name of the disease which grain sustains when affected by the ravages of this animal — *Elliot*

CH'HEENTA, also chhinta HIND From chheentna, to sprinkle, a field in which peas and linseed have been sown by broadcasting, while the rice crops are standing on the ground. When the rice is cut, these crops are left to grow, and are harvested in the beginning of the month Chyete. In Dehh the term chheenta is applied to throwing more seed amongst a growing rice crop. The same word is employed in Gornekpore to signify lands in which seed has been scattered after a single ploughing, more particularly at the extremities of villages, with a view to secure possession — *Elliot*

CH'HEENTA HIND A drop of water, ch'heenté-cheenté panna, spitting of rain. Dud'h ki handi men, pauni ki ch'hinti dalna, to sprinkle water into a jar of milk, meaning to cause unnecessary annoyance — *Elliot*

CH'HINDU. See Inscriptions, No 46

CH'HITUA HIND Broad-cast sowing *Elliot*

CHHOD-TEN, an offering to a buddhist deity, a buddhist temple. There are numerous ch'hodten in Tibet consecrated to the celestial Bud'dha in contradistinction to the Dungen, which are built in honour of the mortal Bud'dhas, and which ought to contain some portion of relics, either real or supposed. Cheese is made by the natives of India, but that used by Europeans is imported from Europe, and is known in the market by names derived from the places of manufacture, such as single and double Gloucester, Stilton, Cheddar, Dunlop, Dutch, Cheshire, &c, &c &c In Britain the principal season for cheese making is from May to September, and it is carried on in nearly every county, but particular districts have acquired great repute. In Cheshire cheese, the salt is well mixed with the curd, and not merely rubbed on the outside. This, which is the most celebrated English cheese, is made in quantities amounting to nearly 14,000 tons annually. The average annual produce of cheese in Great Britain and Ireland is 80,000 tons, most of which is made in Cheshire, Gloucestershire, Shropshire, and Derbyshire. In 1849, 22,081 tons were imported into Britain, of which 14,109 tons came from Holland. The rich cheese called Stilton is made in Leicestershire. It is not sufficiently mellow for use under two years old. Double and single Gloucester cheese is also well known. The former is made of the milk and cream, the latter of the milk and half the cream. Bath and York are famous for cream cheeses. Good cheeses are produced in large quantities, in Holland. In Gouda cheese, which is considered the best in that country, minatie acid is used instead of rennet. Hence it is

never infested with mites. Parmesan cheese from Parma, in Italy, is skim-milk cheese, owing its rich flavour simply to the fine harbage on the banks of the river Po. Swiss cheese, especially that of Gruyere, is pleasing to some tastes. It is flavoured with herbs. British imports of cheese have hitherto been chiefly from Holland—*Tomlinson, page 359, Faulkner, McCulloch's Commercial Dictionary, p 271, Statist of Commerce*

CHEESTA, a river near Panch Gatehee in Rungpoor

CHEETA HIND Plumbago Zeylanicalyllut

CHEETAH HIND The several leopards and panthers of India, are so named, the word meaning spotted, in opposition to the striped markings of the tiger. The word is used by the natives of India, but they prefix another word to indicate the particular animal intended. It is however a term which Europeans use more than natives. Generally, by the word cheetah, is meant the *Felis leopardus*, *Schreb.* The *F. pardus* is called the Gor-baeha, and the hunting leopard the shikari cheetah. The black or kala cheetah is supposed by some to be a variety of the *F. pardus*. The hunting leopard, the *Felis jubata*, is carried to the field on a flat-topped cart, without sides, drawn by two bullocks, each animal has two attendants, and is loosely bound by a collar and rope to the back of the vehicle, but is also held by the keepers by a strap round the loins. A leathern hood covers their eyes. By skilful management the cart approaches within two hundred yards of the game. The cheetah is then unhooded and loosed from its bonds, and it drops quietly off the cart. It approaches them at a slow, crouching canter, masking himself by every bush and inequality of ground. As soon, however, as they begin to show alarm, he quickens his pace, and is in the midst of the herd in a few bounds, rolls over the one he fixes on, and in an instant is sucking the life-blood from its throat. The instant that the deer is pulled down, a keeper runs up, hoods the cheetah, cuts the victim's throat, and receiving some of the blood in a wooden ladle, thrusts it under the leopard's nose. The antelope is then dragged away and placed in a receptacle under the cart, while the cheetah is rewarded with a leg for his pains—*Mundy's Sketches in India, Vol I, p 50*

CHEETA-MEENA, a branch of the Meena race from whom spring the Mair or Meia race, the mountaineers of Rajpootana, one of the aboriginal races of India, whose country is styled *Mairwarra*, or "the region of hills." The Mair is a branch of the *Meena* or *Marna*. The Mair is also called *Mairote* and *Mairawut*,

*Manwarra* is that portion of the Aravalli chain between Koonlmer and Ajmeer, a space of about ninety miles in length, and varying in breadth from six to twenty. Rappootann rises from three to four thousand feet above the level of the sea. *Mera* is 'a mountain' in Sanscrit, *Manawut* and *Marote* 'of or belonging to the mountain,' the name of the Albanian mountaineer, *Marnole*, has the same signification. The *Mai* are a branch of the Cheeta, an important division of the *Mena*, a race which consists of as many branches as their conquerors, the rappoots. All these wild races have the vanity to mingle their pedigree with that of their conquerors, though in doing so they stigmatize themselves. The Cheeta *Mena* accordingly claim descent from a grandson of the last Chohan emperor of Delhi. Unail and Anoop were the sons of Lakha, the nephew of the Chohan king. The coconut was sent from Jessulmer, offering princesses of that house in marriage, but an investigation into their maternal ancestry disclosed that they were the issue of a *Mena* concubine and their birth being thus revealed, they became exiles from Ajmeer, and associates with their maternal relatives. Unail espoused the daughter of a *Mena* chieftain, by whom he had Cheeta, whose descendants enjoy almost a monopoly of power in Manwarra. The sons of Cheeta, who occupied the northern frontier near Ajmeer, became *mahomedans* about fifteen generations ago, when Doodha, the sixteenth from the founder of the race, was created Dawad Khan by the hakim of Ajmeer, and as Athoon was his residence, the "Khan of Athoon" signified the chief of the *Murotes*. Athoon is still the chief town of the *Mai* race. Chang, Jhak, and Rajosi, are the principal towns adjoining Athoon. Anoop also took a *Mena* wife, by whom he had Burrar, whose descendants have continued true to their original tenets. Their chief places are Burrar, Barawara, Mundilla, &c. The *Mena* were always notorious for their lawless habits, and importance has been attached to them so far back as the period of *Beesildeo*, the celebrated prince of Ajmeer, whom the bard Chand states to have reduced them to submission, making them "carry water in the streets of Ajmeer." Like all mountaineers, they broke out whenever the hands of power were feeble.—*Tod's Rajasthan*, Vol. I p. 681

CHEGA. TEL. *Sansevieria Roxburghiana*, Schull

CHEGO, a race in Malabar, who seem to be

noticed by Wilson as the Chegavan or Chickavan, whom he describes as a man of low caste, commonly a *Tair*, one whose occupation is drawing toddy. The tradition is that the Chego came originally from Ceylon, where they belonged to the military caste. The Chego say that in the time of Cheramperumal a washer woman, whose house adjoined that of an *Ajari* (carpenter), being occupied as usual in washing a cloth in water mixed with ashes, and having no one at hand to hold the other end of it, called to a young daughter of the *Ajari*, who was alone in the house, to assist her. The child, not knowing that this was an infringement of the laws of her caste, did as she was requested, and then went home. The washerwoman was emboldened by this affair to enter the *Ajari's* house a few days afterwards, and upon the latter demanding angrily how she dared to cross his threshold, the woman answered scornfully that he belonged now to the same caste as she did, since her daughter had helped to hold her cloth. The *Ajari*, learning the disgrace that had befallen him, killed the washerwoman. Upon this, her friends complained to Cheramperumal, who espoused their cause, and threatened the carpenters, whereupon the latter combined together to take refuge in Ceylon, where they were favourably received by the king of Candy. Cheramperumal begged the king of Candy to send them back, promising to do them no injury. The *Ajari* did not place entire confidence in these promises, but asked the king to send with them two Chego and their wives, to witness Cheramperumal's conduct towards them, and to protect them. The king granted their request, with the stipulation that on all occasions, such as weddings and deaths and other ceremonies, the *Ajari* should bestow three measures of rice on each of these Chego and their descendants, as a tribute for this protection, a custom which still exists. If the *Ajari* is too poor to afford the outlay, he is still obliged to present the requisite quantity of rice, which is then given back to him again, the privilege of the Chego being thus maintained. From these two couples all the Chego of Malabar are said to be descended. This caste comes next below that of the Sudra, but is considered much less honourable. In times of civil war or rebellion, the Chego are bound to take up arms for the lawful sovereign, and some princes employ them as soldiers on other occasions, if they have not a sufficient force of Nairs. Their principal occupation is that of drawing *Toddy*, which is compulsory on their caste, this operation is performed by cutting the top off the cocoa-palm, and collecting in vessels the juice which exudes from it. The Chego are sub-divided

into two castes the Chego and the Twen Chego

CHEHEL PERS Properly Chahal Near the *Jehan Numa* in Shiraz is a building called *Chehal Tan*, "the forty bodies or persons" Another, the *Haft Tan*, or "seven persons," from the number of holy men there buried *Ouseley's Travels, Vol II, p 2*

CHEH'L-WASTI, or captain of forty, amongst the Nasiri, a nomad race who occupy the Toliti and Hotnki countries in summer and the Daman or skirts of the Suliman range in winter In their migrations, they appoint a cheh'l wasti or captain of forty and a director general See *Affghan Nasiri*

CHEHOOR, a pale brownish colored cordage of Beerbhoom, coarse and of moderate strength.—*Royle*

CHEIRANTHUS CHEIRI *Cruciferae* Wall Flower The name is from Cheir, the hand, and anthos, a flower Derives its English name from growing wild on old walls and ruins in England It is of a light yellow colour, but, when cultivated in gardens, assumes a rich dark tint, mixed with brown The double variety of a yellow colour, and striped with deep orange, is seldom known to blossom in the peninsula In the Punjab it is called Lahori subu.—*Riddell*

CHEIRONECTES The frog-fish of the British, in India, belongs to the family of Iophiadæ or anglers, and are met with in many seas In this group the bones of the corpus form arms that support the pectoral fins, and enable these fishes to walk along the moist ground, almost like quadrupeds Cheironectes immaculatus, Ruppell, has feet or claws rather than fins.—*Tennent's Sketches of the Nat Hist of Ceylon, p 330, 331* See Fishes

CHEIROMELES TORQUATUS HORSE One of the Vespertilionidæ found in Sumatra, Java, Borneo, Siam and Western Asia It is 5½ inches, long, and expansion nearly two feet

CHELICUT, near Antalo in Tigre, in 163

**Abyssinia** This town is said by Lefebvie and Feriet and Galmei to contain about 3,000 inhabitants — *James' Par Pass*

**CHELIFER** Amongst the insects which infest books in India are two genera, which are usually regarded as accomplices in the work of destruction, but which, on the contrary, pursue and greedily feed on the larvae of the death-watch and the numerous acari which are believed to be the chief depredators that prey upon books. One of these malignant genera, is a tiny tailless scorpion (Chelifer), of which three species have been noticed in Ceylon, the *Ch librorum Temp*, *Ch oblongum Temp* — and *Ch acaroidea Hermann*, the last of which it is believed had been introduced from Europe in Dutch and Portuguese books. Another genus of book insects is the *Lepisma*, the fish insect genus, and called so by Fabricius from its fish-like scales, tiny silvery creatures which feast on the acari and soft bodied insects that infest books. There have only been two species described viz, the *L inven-fasciatus* and *L niger, Temp*. It has six legs — See *Banc*

**CHE-LING TCHA POO** A division of the country of the Kalkas, in the district of Pola, adjoining the Russian district Selingsky. See Kalkas

**CHELKA DUDUGA** Tril Uniona discolor

**CHELLAWN II**, properly Chilan, an in voice, a passport, from Chilana, Hind, to forward

**CHELLU TAM** Termites

**CHEL-MAR-ZAI** One of the four divisions of the Med, & sea faring and fishing population on the sea ports of the Mekran coast, the other three divisions are Guzbur, Hormari and Jellar zai. See Kelat, p 492 Mekran

**CHELMON ROSTRATUS LINN** One of the archer fishes *Chaetodon rostratus* Shaw, is, according to Sir J E Tennant, the archer fish of the fresh waters of India. On seeing a fly settle over head on a leaf, it propels a drop of water and brings it down. See *Chaetodon toxotes*

**CHELONE** Flowering plants named from *Chelone*, a tortoise, the flowers are scarlet, orange, white and purple — *Riddell*. See *Scrophulariaceae*

**CHELONIA**, an order of reptiles, known as tortoises and turtles, generally considered the first by zoologists. They are also termed *Testudinata*, from *testudo*, the Latin for a tortoise. They belong to the section of *Cataphraeta* or shielded reptiles, and the families, genera and species in S. E Asia are as under. —

" *midas* " of Bengal,

*Chelonia midas* is the green turtle.  
*Caretta imbricata*, Hawksbill turtle, *Ch*  
*Caouana*, Loggerhead turtle. As an article of  
food, the Green turtles (*Tortues Franches* of the  
French), are so highly prized that they have  
become a considerable article of commerce.

The fat of many species, when fresh, is used with success in lieu of butter and oil in cookery, and in those kinds which have a musky odour (*Chelonia*, *Caouana*, and *C. Caretta* for instance), is used for embrocations, leather-dressing, and as lamp oil. The imbricated turtles furnish that valuable article, tortoise-shell, or rather the best sorts of it, so highly prized in ancient and modern times, and so ornamental and useful in the arts. The eggs of all species, particularly those of the Green Turtles, are excellent. The following Asiatic *Chelonia* are arranged according to their geographical distribution, from Dr J E Gray's "Catalogue of the Tortoises and Crocodiles, &c., in the collection of the British Museum."

CHENA CULTIVATION ANGLO SINGH  
In Ceylon, means patches of forest, burned, cleared and cultivated for two or three years and then abandoned, and allowed to become forest lands again. This destructive form of cultivation is known as Kumari on the western coast of India — *Tennent D. Cleghorn* See Kumari

CHENA HIND Panicum miliaceum P. pilosum. It is sown and reaped in the hot season after all the rubber crops have been cut. It needs much water, hence the saying

Chena ji ka lena,  
Choudah pan dena,  
Bya chale to, na lena na dena,

To get the chena crop water it fourteen times. If a blast strike it, then neither harvesting nor selling — *Elliot*

CHENAB, the Acesines of the Greeks, is the largest of the five great rivers of the Punjab. It is also called the Timab. Ptolemy called it Sindabal or Sandabilis, but the Greek historians of Alexander called it Akesines. Its source has never been reached by Europeans, but is placed in the high land of Tibet, about lat 32° 50' N, lon 77° 40' E near the Bara Lacha pass. The Chandra and Bhaga rise on opposite sides of the Bara Lacha pass which is in lat 32° 45' N and long 77° 22' E — and as their junction form the Chenab, they give also its sanscrit name Chundra-bhaga, or moon garden, which the Ayeen-i-Akbari, calls the Chanderbaka. It runs north-west to Murumudwun, south west to its confluence with the Jhelum, thence south-west to the Ghara, or continuation of the Sutlej. Its length to the Ghara is 765 miles. It descends at the average rate of 40 ft per mile for the first 200 miles. Its estimated elevation at Kishtwar, is 5,000 ft. It receives the Suruj Bhagu Murumudwun and the Dhark all short streams. It becomes navigable for timber rafts at Aknur. Above Darwas, the Chenab is a rapid, noble river, running through a deep rocky channel. The portion of the Chenab which passes through the territories of the maharaja of Kashmir is about 200 miles long. From the junction of the Chandra and Bhaga at Tandi, in British Lahul, to Aknur, where the river debouches upon the plains, its length is about 300 miles. The fall, according to General A. Cunningham, is 34 feet per mile from Tandi to Kisthwar, and 26 feet per mile from Kisthwar to Aknur. The flora of the upper valley agrees in most respects with that

of Kunawar, lower down there is an approach to the vegetation of the outer Himalaya — *D. Thomson's Travels in Western Himalaya and Tibet*, p 348 *Cleghorn Punjab Report*, p 134, 153 *History of the Punjab, Vol I*, p 10, 11 See Jamu Khetu Punjab

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 feet Entirely a rain crop, grows to six feet high, seeds considered nourishing — *Cleghorn Punjab Report*, p 66

CHENSUAR, or Chenchwar, (Suar or Surab) also Chentsu, a wild, half-savage, forest tribe inhabiting the Eastern Ghats of the peninsula of India They are known to their settled neighbours as the Chenchukulam, Chenchwar, and Chensuar They seem to be the people whom Wilson names Chenchu vadu (vadu, Tel, a man) They are about 1,200 in number, and dwell in the tract of jungle covering the westernmost range of the Eastern Ghat line, between the Pennar river and the Kistnah, and known locally as the Nulla Mulla, and the Lankamulla They inhabit clearings in the forest, live in beehive

shape huts like the African, Nicobarian and many of the ruder Asionesian tribes. These are of wicker-work with walls about three feet high, and a conical straw roof, with a screen for a door. The men are almost nude. The women dress like the wandering female basket makers whom they resemble in features. The features of the men are small, but the expression is animated, cheek-bones higher and more prominent than those of the hindus in general, nose flatter, and nostrils more expanded, then eyes black and piercing, in stature they are slightly shorter than their neighbours, and they are slightly, but well made, except about the knee, which is large, and the leg. The colour of the skin is darker, and there seems a tendency to cutaneous eruption. Newbold characterises them as between a Tiling and a Jakun of the Malay peninsula. They have no language of their own, but speak Telugu with a harsh and peculiar pronunciation. Brahmins say they formerly were shepherds of the Yerra Golla caste. They have large dogs, and a few are employed as hill police, in the pass from the Kuman to Badwail. The Nandial Chenchwar assert their ignorance of a god or a soul. They have no images. They are polygamists, they bury their dead, but sometimes burn, and, like the Tartars, the Nandial Chenchwar carry the deceased's weapons to the grave. They use the spear, hatchet, the matchlock, or a bamboo bow and reed arrow tipped with iron. They look on weaving and other manufacturing arts with contempt, and they have in general only a rag for covering. They are patient and docile. It is suggested by Mr Logan that the Chensuar are a continuation of the wild forest Surah of the mountainous tracts further north in the line of the Eastern Ghats. Vocabularies of six of the non Arian tongues, the Kond, Savara, Gadaba, Yerukala, and Chentsu are given at p 39, No of 1856, of Beng As Soc Journal. Newbold in R As Soc Journ 1865 Logan in Journ Ind Arch — *Newbold*

CHENSU KARRIR, a migratory race mentioned by Buchanan as residing in the hilly tracts near Coimbatore. They are described as without houses or cultivation, but by snares, or with the bow, catch birds or large game which they dispose of for rice, the white ant is said to be used by them for food. They approach their game under the shelter of a cow or buffalo, which they have taught to stalk. Their language is a dialect of the Tamil with a few Canarese words intermixed. Those near towns learn the use of Telugu words. A Tamil man is unable to understand their language. A few reside in little huts outside, on the outskirts of villages, and have

a little blanket, but their ordinary clothing is a loam cloth, and in the denser forests they dwell in caves or hollows of trees, or under the shelter of a hut made of branches of trees, and use only a few leaves for covering. They describe the Animal as their original country. *Buchanan.*

CHENVUKOTTI MAL A coppersmith.  
CHEONTI, HIND Ant ENG

CHEPANG, Haiyu and Kusundu, three uncivilized Bhot tribes who reside amid the dense forests of the central region of Nepal, to the westward of the great valley, they dwell in scanty numbers, and nearly in a state of nature. They have no apparent affinity with the civilized races of the country, but live in huts made of the branches of trees, on wild fruits and the produce of the chase. The Chepang are slight, but not actually deformed though with large bellies. Mr Hodgson says they are of Mongol descent. Their language is akin to the Lhopa. The Chepang, Haiyu, and Kusunda, seem to belong to the Rawat group of frontier populations. They are named by Mr Hodgson, the Durre, Denwar and Bramho, which Mr Latham believes to be the same as Tharu, Dhungur, and possibly Ravi, but more likely Dhei, Dungar and Brahman. They occupy the districts where the soil is moist, the air hot, and the effluvia miasmatic. Nothing is known of their language — *Latham*. See India, 311, 317

CHEPATI HIND Cakes made of wheaten flour and water or milk, and baked on the girdle. They form the principal article of diet of the hindoos of North-western India and of the rajpoot races.

CHEPOOROO VALELLOO, a grass grown in Kimediy, from the roots of which neat table mats and teasing brushes are made. At the Madras Exhibition of 1855, a few neat table mats were exhibited from Kimediy, and some teasing brushes made from the roots of this grass, such as likely to command a ready sale, if they could be brought prominently to notice. The botanical name of the plants from which they are made is not yet ascertained.

CHERA *Thalictrum foliolosum*.

CHERA, an ancient dynasty in the south of the Indian peninsula, the rise and fall of

which, as also the extent of their dominions, are only vaguely known. They seem to have risen on the fall of the Pandya sovereignty, and to have ruled over Travancore and Coimbatore, and parts of Salem. See Kerala, Narapati, Pandiya.

**CHERAITA HIN** The name given to the stalks of several Indian plants, all of them valuable bitters, equivalents of gentian, obtained from the genera *Ophelia*, *Fraxin*, *Adenema* and *Andriographis* (Justicia). The properties of the Indian species of Gentianese, with the exception of two or three of the Himalayan ones, do not seem to have been largely investigated.—*Dr. Cleghorn Ed. New Phil Mag No 6 of April 1856* See Chiretta.

**CHERAKEN JAV** *Croton* seed.

**CHERAMBOLA PORT** *Cicca disticha*.

**CHERAMELLA, or HARRI-PHAL BENG** *Cicca disticha*.

**CHEREMIN MALAY** *Cicca disticha*.

**CHERAM PERMAL** an ancient sovereign from whom all the royal races of Malabar claim descent, and who is supposed to have built Cahut.

**CHERAN**, the name of the Chera race, who ruled at Kerala on the Malabar coast. See Chera.

**CHERA PUNJI** a town and hill station in the Khasia hills, 360 miles from Calcutta. See Cherra punji.

**CHERIBON, or CHERIMAI** A mountain, in lat  $6^{\circ} 54\frac{1}{2}'$  S, and long  $108^{\circ} 28\frac{1}{2}'$  E in the north of Java, is 10,023 feet high.—*Horsburgh*.

**CHERIKER BODI TEL** *Saccharum officinarum* *Linn*.

**CHERIMELLE** In Japan, this fruit is pricked all over with a needle, and laid in water. For use it is boiled up with sugar, and kept with syrup in glass bottles. These fruits are often eaten with tea. They are sometimes eaten unripe with a little salt, and may, likewise, when in that state, be preserved in salt. Sometimes they are eaten ripe, and have then a subacid taste.—*Thunberg's Travels, Vol II, p 292 and 293*.

**CHERIVELU TEL** *Hedyotis umbellata* *Linn*.

**CHERKUSH HIND** *Prunus Armeniaca*.

**CHEROMAR**, a slave race of Malabar, who follow the rule of Maruma Katayan. See Polyandya, p 108.

**CHEROO**, aborigines in Ghazeeপুর, a part of Gorukpur, the southern part of Benares and Mirzapur and Behar. They are sometimes said to be a branch of the Bhur. They seem to be the same as the Sivira or Seoree, but Buchanan considers them distinct. The Cheroo declare themselves to be descended from the great serpent, from which they may

be supposed to be the Nagbhusi of Magadha. Remains of buildings attributed to them, are found near Buddha Gya, Sasram and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the Hindu religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhogpur, the Hyohani of Hindi, and the Bhoohani, a little before the first mohomedan invasion, about which time there seems to have been a general convulsion in India, during which several tribes acquired their present possessions. The features of the Cheroo are said to resemble the occupants of the Vindhya mountains. They live by cutting timber, collecting drugs, and killing game, and though their numbers are very low, they continue to create a rajah for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah subdued Muhatta, a Cheroo zemindar of Behar, which seems to have been a last but strong effort of the Cheroo. The chief of Singrowh in Mirzapur is a Cheroo, though he calls himself a Ben-hanc. Sir H Elliot suggests that the Sivira, Seori and Cheroo, may perhaps be the Samraseni. In the Hari-vansha is the following passage: "From this race came the Samavira, and Samraseni. The great king Samraseni has given his name to the country over which he reigned"—*Elliot Gloss*.

**CHEROOAH GHAUT**, in L  $74^{\circ} 0' E$ , and L  $21^{\circ} 18' N$ .

**CHEROOKA TEL** *Saccharum officinarum*.

**CHEROO-MUTU BENG** *Amrantsus polygonoides*.

**CHEROOPU**, also Chupatu TAM Shoes.

**CHEROOTS** The dried leaves of the tobacco plant, formed into small rolls for the purpose of smoking. Havannah cigars are usually reckoned the best in Europe. In India, Manilla cigars are most esteemed. Imitation Manillas Chinsurah Cheroots, Lunkah, Dindigul, and Trichmopoly cigars are the chief kinds manufactured in India.—*Faulkner*.

**CHEROFANNY TAM** A light coloured wood of Travancore, used for firewood.

**CHERRA GADAN TEL** *Indigofera enneaphylla*.—*Linn*.

**CHERRAPOONJI**, a sanitarium in the Khasia hills, in l  $25^{\circ} 11' 2'' N$  and L  $91^{\circ} 40' 5'' E$  about 4118 or 4125 feet above the level of the sea. It is 40 miles north of Sylhet and 60 miles south from Gowhatty. The principal race in the neighbourhood are the Khasia, able bodied people, who differ little from the Garo. They are arranged in petty rajahships in the Khasia hills. They build their houses on piles, they trap fish like the people of Borneo, Java, and Sumatra. They

dread snakes, and Nat worship seems their peculiar culture. They distil and drink in intoxicating liquors. At a place between Rungt and Cherrapunji, and at other places in the hills, are bridges made of the fibre of the India-rubber tree, as described by Captain Yule. This race inter their dead in places where they erect oblong pillars, hewn or unhewn, three to thirteen in number. The climate of Cherrapunji is suited for a sanatorium. Colonel Watson described it in *Bl As Trans* 1834, vol. iii, 25. Fall of rain at Cherrapunji has amounted to 600 inches. The average fall for August 200 inches. In 1841, 264 inches fell, occasionally 20 inches fall in twenty-four hours. — *Bl As Trans* 1844, vol. xiii, 614. *Dr. Bursts Catalogue Latham*. See *Carns*. Cherrapunji.

CHERRIES See Cherry, Fruits.

CHERRO CANNY. TAM? A light brown coloured wood of Travancore, only used for firewood. — *Col Frith*.

CHERUKU, also Cherukulo bhedam TEL *Saccharum officinarum*, L — R 1, 327. The SANS Sju is *Pundarika*, a variety of the sugarcane.

CHIRUMAN, a class of pedial slaves in Malabar, whose name Wilson derives from Cheru, *Maleal*, the soil. General Briggs names a non-Aryan race Cherumai — *Wils Briggs*.

CHERU PINNAY TAM *Calophyllum spurium*.

CHERU-PUNA in Tamil and Malayala, is the small leaf poon. This wood is the real mast poon, which is preferred for the masts of ships or vessels. Poon, or Puna, consists of five sorts, all of which are similar in shape and growth, the large sort is of a light bright colour, and may be had at Mangalore, from the forests of Coimbatore, in Canara, where it grows to a length of one hundred and fifty feet. At Mangalore, Mr. Edye procured a tree of this sort that would have made a foremast for the *Leander*, sixty-gun ship, in one piece, for the sum of 1,300 rupees, or £149 sterling. Poon grows in the forests of Cochin and Travancore, but it is of a very inferior quality to that before stated, one sort is named the Karup Puna, which is dark poon, and Malai Puna, meaning the hill poon, and another sort, the Vellai Puna, or the white poon, this sort is small, not more than twelve or eighteen inches in diameter, and eighteen or twenty feet long. In Canara, another sort, named Mariche Puna grows to twenty-eight inches or three feet in diameter, and from thirty to fifty feet long, and is very much like American birch. It is generally defective and not durable, consequently, it is never brought from the hills for, when felled, it opens and splits at the top and but for many feet in length. The weight of the poon may be said to be from forty to forty-eight pounds the cubic foot, but the lightest he met with was thirty-four and three quarters, and the heaviest fifty pounds the cubic foot when dry. The leaf of this tree is small and oval, about two by one and a half inches broad, and the fruit grows in bunches, it is about the size of coffee-berries, from this the natives extract oil, which is

used for various native purposes — *Eyde, M and C*

**CHERVIL** *Chærophylum sativum* The leaves are used in soups and salads

**CHETANA SWAMI**, a hindu religious teacher, the preceptor of Baba Lal, who founded the Baba Lal sect

**CHETCHINZI**, or Tchetchinzki are tribes who were considered the most formidable of all those which inhabit the innumerable rocky valleys of the eastern line of the Caucasus. Their predatory excursions, whether in large or small bodies, were not only a dread to their own immediate neighbours, tribes like themselves, though of less extent and power, but their sudden descents, ambuscades, and continued warfare, kept the disciplined Russians constantly on the alert. These lords of the mountains seemed never to rest, day nor night. Unwearied in their watch for prey, like lightning in attack, for they struck, or were lost to sight as quickly. As the mahomedan was the last religion attempted to be introduced amongst these people, they suppose themselves to be good mussulmans. But they have not any knowledge of its doctrines. They have no priests of any kind, hence their marriages are mere domestic contracts, agreed on between the parents of the parties. The bride always brings a dowry, consisting of cattle, &c, proportioned in value according to the wealth of her family. She is brought home to the house of her betrothed husband, and then the ceremony is completed by dancing, drinking, and carousal. From the custom of the sons never migrating from the paternal spot, families, from one

stock, increase from single sheds to considerable villages. Each habitation of these people is separated into three divisions: one for the women, another for the men, and a third for the horses and other cattle. The whole little establishment is then encircled by a fence of wicker-work, or stones — *Porter's Travels, Vol I, p 62*

CHICACOLE, a town in the Northern Circars, on the eastern side of the peninsula of India. In November 1753 M Bussy obtained it for the French Company, but it was afterwards ceded to the English. The sea face of the mountains in this district does not contain any tree vegetation which can be denominated timber. The Northern Circars consist of the four provinces of Mustafanagar, Ellore, Rajamundry and Chicacole. They were ceded to the French in 1753, and to the English E I Company in 1759. They contain the important towns of Ganjam, Chicacole, Vizianagram, Vizagapatam, Coriuga, Yanoor, Masulipatam, Ellore and Nizampatnam. It runs from the Chulka Lake to Motapilli, along 470 miles of sea coast, with a breadth of from 70 to 100 miles of low country, an area of 17,000 geographical miles watered by the Kistna, the Godavery and Godecrina — *Dr Cleghorn's Report*

CHICALDAH, a hill-station in Berar. See Chikuldah

CHICANE is the game of Chougan, once universally practised throughout Persia, and formerly often played on a level piece of ground near Shiraz. As a game on foot, we have it in the cricket of England, the Golf or Gough and Slintey and hockey of Scotland, and the Hurling-matches of Ireland. Pietro della Valle (*Viaggi, Lettera de Casvin 25 Luglio 1618*) discovered it in the Florentine Calcio. *Ci' e solo questa differenza tra il giuochio de Persiani e 'l calcio de' Fiorenti, che i Fiorentini giucano con molta gente a piedi &ca, Ma i Persiani, piu nobilmente giucano a cavallo.* Sir William Ouseley sees the name Chugan appear, but slightly disguised in the chicane of Languedoc, where the game is played as in Persia, with a wooden ball and a club headed like a mallet or hammer — *Ouseley's Travels Vol I, p 346*. See Chougan

Cedar	"		"

This tree occurs in the mountainous countries to the east of Bengal. It was discovered by Mr Nimmo on the Toongur Hills in 1838. It occurs in Chittagong, also in Coimbatore, &c, where, in common with one or two other light red-coloured woods, it currently passes under the general name of cedar or bastard cedar, and all are extensively employed in cabinet making. This has quite a cedar-like smell. The wood is well known in Madras and easily procured, and is extensively used in cabinet making, coming under the denomination of "Chittagong wood," being imported from that province, though it is abundant in the mountainous parts of the peninsula. It is close grained, light coloured and delicately veined, makes beautiful and light furniture, but is apt to warp during the season of hot land winds. According to Dr Gibson, it is a fine straight-growing tree, rather common in the southern jungles of the Bombay Presidency, but much less so in the northern. Its wood could easily be creosoted. It is valuable for cabinet and house purposes, and is used in the Madras Gun Carriage Manufactory to make plane tables and for furniture work. It furnishes one of the Deodars of Malabar. It is found also in Canara and Sunda, in the tall jungles near and on the Ghats, particularly at Gunesh Good Wood there whiter, but tough and close grained, and, from its general situation, it is hardly known to the carpenter. It grows in the warmer parts of Ceylon. Dr Brandis tells us that there is scattered throughout the forests on elevated ground in British Bumah (large trees are scarce) a tree either identical with "Chitta-

gong wood" or nearly related to it. A cubic foot of it weighs lbs 24, and in a full grown tree on good soil, the average length of the trunk to the first branch is 80 feet and average girth measured at 6 feet from the ground is 8 feet. This wood was not known to Mr Rohde as a product of the Northern Circars, but was imported there among the "Chittagong woods." Beautifully veined and mottled pieces, he says, are occasionally met with, but its complaints during the season of the hot winds and dry northerly winds of November and December, in the Northern Circars, render articles made of it, containing wide planks and framing, as armchairs, very disagreeable bedroom companions. The Chittagong-wood, he adds, is used at Madras for all purposes for which ordinary mahogany would be used in Britain, as furniture, panels of carriages, &c, and one variety is sufficiently tough to be employed for felloes of wheels. Mr Rohde concludes that all the woods imported under the name of "Chittagong" is not the produce of the same tree, the only wood of the Circars at all resembling it is the "Pinna ayemba" of Ganjam and northern parts of the Vizagapatam districts. Indeed, it would be difficult, so far as his recollection enables him to state, to distinguish one from the other, though he believes it to be from a species of neem, *Meliazaderachta*. These remarks will show that the wood of the *Chickiassia tabularis* enters the market indiscriminately, as one of the cedars, bastard cedars, deodars, and Chittagong woods, and that several woods are known in the market under the name of Chittagong wood, though seemingly all possessing a similarity of character which prevents them being distinguished, but allows of them all being used for one another. The bark is powerfully astringent — *Mr Rohde Roab* ii 379 *Dis Gibson, Wright, Cleghorn, Brundis, Voigt* 137 *Thw En Pl Zeylan* i 61 *M E J R O'Shaughnessy*, p 250

CHICKUN, also Chickun dozi. HIND Plain embroidery. That in use for European families is usually called 'work' or Chikkan work. It is a large branch of muslin work of India.

CHIKULDAH HILL in lat  $21^{\circ} 9' N$ , and long.  $74^{\circ} 59' E$  A table land near to and somewhat higher than the fort of Gawilghur. Gawilghur is situated in about  $121^{\circ} N$ , and  $177^{\circ} E$ , and its height above the plain is 2,300 feet, thus it will be 3,600 feet above the level of the sea, since this part of the Betar valley is 1,300 feet above the sea. Chikuldah, elevated 3,750 feet, is on the Vindhya, or as some call it, the Gawilghur range of hills, and about 20 miles from the cantonment of Ellichpore. The plateau of Chikuldah is not above three quarters of a mile broad, and about a mile in length. The more gentle scenery of a vast sylvan tract is seen away towards the north, covered with high grass and forest trees. Good roads have been made along the irregular plateau commanding fine views of the neighbouring country. From November to the end of June, a total of eight months, the mean temperature was  $71^{\circ}$ . The hottest months were April and May, giving a mean of  $83^{\circ}$ . The coldest months were January and February, having a mean of  $59^{\circ}$ . Thus producing between the hottest and coldest months, a range of  $24^{\circ}$ . The coldest day observed was the 9th of February at sunrise, being  $47^{\circ}$ . The hottest day noticed was on the 27th April, at 2 P M, being  $96^{\circ}$ . Between the extremes of heat and cold, there was therefore a range of  $49^{\circ}$ . The greatest monthly range was  $14^{\circ}$  in November. The greatest diurnal range was  $22^{\circ}$  in April and May, the least diurnal range was  $4^{\circ}$  in February and  $5^{\circ}$  in June. The wet bulb thermometer during the hot months, had an average depression of  $10^{\circ}$ . The thermometer averaged a general range of about  $10^{\circ}$  below the temperature of Ellichpore. The rains cease about the middle of September, heavy dews then occur until the cold weather begins, and also from February to the rains. At this period the moist atmosphere is bright and transparent, but becomes hazy as it gets less dense towards the hot weather — *Captain Bond*. See Sanatoria.

CHIL, also Chin, in the N W Himalayas, are the generic terms for the genus *Pinus*, and *P. excelsa* and *P. longifolia* are so named.

CHILAONI HIND Current coin

CHILAS This country is bounded on the north by the Indus river, on the south by the watershed of the ridge over Looloosur Lake, on the east by the watershed of the same ridge as above Looloosur Lake culminating in the lofty peak of Mung Parbut, the Astor boundary marches with Chilas here, on the west to a point beyond the village of Sazeen, where the Indus takes a turn to the south west. Chilas affords good pasturage but lies under snow for a considerable portion of the year. The Sheen claiming an Arab descent are the proprietary and governing class. Crime is rare, women have more liberty and power than among mahomedan tribes, and breaches of chastity are punished by death. They were visited in 1866 by Dr. Leitner at the request of the Bengal Asiatic Society. Their language seems distinct from Pushtoo, Persian and Hindi, and is not understood by their neighbours the Syud race, who inhabit Duniel and Tankeel to the west of Ghulghit. According to their own traditions, the inhabitants of Chilas were conquered about the middle of the 18th century, and converted to the mahomedan faith. Up to about 1840, the Kahghan Syuds received quantities of gold dust as religious dues from the people of Chilas, but when the Syuds, aided by the Sikhs, failed in an attack on Chilas, the dues were abandoned. A second attack by the Sikh nation was successful, and a small annual tribute of 3 tolahs of gold dust and 100 goats is paid to the Cashmere durbar.

CHILDREN are greatly longed for by all the races inhabiting the south and east of Asia. One prevailing feeling regarding them is such as is expressed in Psalm cxxxvii 4, 5, "as arrows are in the hand of a mighty man, so are the children of the youth. Happy is the man that hath his quiver full of them, they shall not be ashamed, but they shall speak with the enemies in the gate," for most persons will hesitate to attack a large united family. Amongst hindus and Chinese, with whom spirit-worship largely prevails, sons are particularly longed for, in order to obtain from them duties to the manes of their parents. The eastern custom of nursing a child from the hip or side, as in Isaiah lx 4, is still continued, and a child born after vows, is still, as in Proverbs xxxi 2, called the son of a vow. As in Genesis xxv 6, the children of mahomedans, born of a wife of humbler birth, or of a harem woman, are not deemed equal in social rank to the children of a high-born wife. Infanticide is still continued amongst certain rajpoot races, but the causes are not for fulfilment of any vow or from any religious duty, but pride or poverty induce them to destroy their female children, and many rajpoot tribes have the utmost difficulty in obtaining wives. The Chinese have complete power over their offspring, even to life, but in no country of the south-east of Asia is the sacrificing of children, on religious grounds continued, though, down to comparatively recent historic times, the Phœnicians, Carthaginians, Aramæans, Syrians, Babylonians and even Israelites, and their neighbours on both sides of the Jordan, sacrificed their children with the hoped for object of averting any great and serious misfortune. A Phœnician legend is of El, the strong, offering up his son Yedud or Yedid, the beloved. El being the Kronos (*Bunsen*, iii 286). Malekh Bel was the same as the Tyrian Hereules, or Moloch or Bal-Moloch, to whom, as also to Hecate and Melekhet Artemis, dogs were sacrificed. In Babylonia (Is lxvi 3, Ez xiii 13, xxxiv 20) their neck or backbone had to be broken unless redeemed. The principal sacrifices offered to Hereules Ussoo, as well as to his mythical companion, were human beings, which in Laodicea of Phœnicia might be ransomed by a doe. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank in honour of Hercules, continued down to their latest wars. The legend of the Grecian Hercules is that he became insane, burned his own children, as well as those of his twin brother Iphicles, and murdered his guest Iphitus. *Bunsen* iv 212, 213. See China Harm Infanticide Rajpoot

CHILIANWALAH, a battle was fought here on the 13th January 1849, between the British in India and the Sikhs, where 14.2 per cent of the British soldiery fell in the action. It lies between the Chenab and the Jhelum rivers.

CHILI STRAWBERRY Strawberry.

CHILIVA HIND The "Indian Bleak" of N.W. India, a lonely little fish seldom reaching more than 2 or 3 ounces, he is active, playful, and ravenous, his appearance like new silver (the scales being used in making false pearls) and he ranks among the most delicate at table. In many parts of Northern India enthusiastic Lady Anglers with a long graceful wand, "whip" for him with great success, on fine clear evenings, near the cold season, with tiny midges, of rainbow hue, begirt with *gold tinsel*. *Five pounds weight* and more of these pearly playthings have been the reward of a lady party on one evening, caught without much exertion from a boat and under the shade of contiguous *Topes* and groves along the "Raptée." Besides the artificial fly, the chiliva greedily seizes everything from a mosquito to a butterfly,—and a grub or flesh maggot, a bit of paste, or a large grain of tough rice are equally good. He is essentially a *surface* fish,—active and cleanly in his predilections, of a delicate constitution, he soon dies after handling, especially if he has been hooked,—the casting net is the proper *modus operandi* to get stock fish for a water and the supply should be kept *very few together* or they will rapidly die. Earthen pans carried on a pole across a man's shoulder by night are best. This fish is *very prolific*, but his enemies are abundant in proportion. From his surface habits he falls an easy prey to the ducks, fish hawks, kingfishers, snakes, turtle, &c. To feed them or cause them to congregate, burn a little ghee, or fat in a pot over the fire and when it begins to smoke, empty out the contents on the pool or lake, and you will soon see the *Chiliva* hunting this new food on the surface,—coarse flour slightly melted and thrown in will also attract a great number, the casting net thrown on the spot will astonish you with its silvery load. The Indian Angler prizes the little *Chiliva* beyond all his confreres, for he is the shining *bonne bouche* which

when properly spun on a first class rapid tempts the majestic *Mahseer* of discreet 50 to 100 lbs from all his propriety, or seduces the golden eyed *Bolhar* of 20 to run a wreck In these parts, too, he is rare Extirmination has been his unavoidable fate, and one has walked miles oft in vain for his sake, and fruitlessly offered rewards for his apprehension with the view of offering him as a sacrifice to some "Mourrah of the Pool" who refused to be "at home" for any smaller dandy

**CHILKA LAKE**, a marine lagoon in the Ganjam and Cuttack districts on the north-western side of the Bay of Bengal It bounds the Northern Circars on the north It seems the result of the breach of the sea over a flat sandy shore, whose elevation is something above the level of the country within Puhit lake appears to have the same origin Each of them communicates with the sea by a very narrow but deep opening, and are shallow within The Chilka lake is about 40 miles in length from N E to S W and in most places 12 or 15 miles wide — *Kennell's Memoir*, p 242

Chillies, or capsicums, are long roundish taper pods, divided into two or three cells, filled with small whitish seeds The scientific relations of the genus producing these fruits will be found under the article *Capsicum*, and we will here attend chiefly to the culinary and commercial values Chili is the Mexican name for all varieties of *Capsicum*, though they are natives of the East and West Indies, and other hot climates *C. annum* is the species commonly noticed, but there are numerous varieties which, by many, are reckoned species Thus *C. frutescens* is a shrubby plant, which grows to a large and more bushy size, *C. minimum* supplies the variety called bird-pepper *C. baccatum* has a globular fruit, and furnishes cherry or berry capsicum They are all of the simplest culture, but culture appears to increase the size, and to diminish the pungency of the fruit Their acidity is owing to an oleaginous substance called capsicin When the fruit is fresh, it has a penetrating acid smell it is extremely pungent to the taste, and produces a most painful burning in the mouth When dried, they form a large article of local and foreign traffic, and form the basis of Cayenne pepper, but in vinegar, when green or ripe, they are an acceptable pickle In Bengal, the natives make an extract from the chillies which is above the consistence and color of treacle The consumption of the chillies in Southern and Eastern Asia is immense, as both rich and poor daily use them, and they form the principal ingredient in all chutnees and curries, ground into a paste, between two stones, with a little mustard, oil, ginger and salt, they form the only seasoning which the millions of poor in those countries can obtain to eat with their rice They are worth about 40s the curdy of 600 lbs Cayenne pepper is used in medicine chiefly in the form of tincture, as a rubefacient and stimulant, especially in cases of ulcerated sore throat It acts on the stomach as an aromatic condiment, and when preserved in acetic acid it forms Chili vinegar Red pepper may be considered one of the most useful vegetables in hygiene As a stimulant and auxiliary in digestion, it has been considered invaluable, especially in warm countries Immense quantities of the capsicum are used by the native population of the West Indies, Africa and Mexico, the consumption there as a condiment being almost universal, and perhaps equal in quan-

tity to salt The "wort" or Cayenne pottage may be termed the national dish of the Abyssinians, as that, or its basis, 'dillock,' is invariably eaten with their ordinary diet, the thin crumpet like bread of teff or wheat flour Equal parts of salt and the red cayenne pods are powdered and mixed together with a little pea or bean meal to make a paste This is called "dillock," and is made in quantities at a time, being preserved in a large gourd shell, generally suspended from the roof The "wort" is merely a little water added to this paste, which is then boiled over the fire, with the addition of a little fat meat and more meal to make a kind of porridge, to which sometimes is also added several warm seeds, such as the common cress or black mustard, both of which are indigenous in Abyssinia A kind called the Tobago red pepper, is said to possess the most pungent properties of any of the species It yields a small red pod, less than an inch in length, and longitudinal in shape, which is so exceedingly hot that a small quantity of it is sufficient to season a large dish of any food Owing to its oleaginous character, it has been found impossible to preserve it by drying, but by pouring strong boiling vinegar on it a sauce or decoction can be made, which possesses in a concentrated form all the essential qualities of the vegetable A single drop of this sauce will flavor a whole plate of soup or other food "Johnston's Abyssinia" quoted by O'Shaughnessy *Faulkner Simmonds*, p 429. See Capsicum Capsicum annum Cayenne

CHILLIMILLI TEL *Cicca disticha*

CHILLOOR—? *Cæsalpinia sepiaria*

CHILLOUNEA A singular tree of Nepal Its upper coat is entirely composed of innumerable needle-form fibres, tolerably united by a kind of gelatinous sap The wood makes good beams and rafters, and is held in such superstitious veneration by the natives, that no house is considered secure in which more or less of the timber has not been employed —*Smith's Nepal*

CHILLY ENG *Capsicum species*

CHILMAD, a town mentioned as trading with Kanneh, Ez xxvii 21-23

CHINA The empire in the extreme east of Asia, known to Europe by this name, is called by the western Mongols, Kathay, by the Mantchu Tartars it is called Nikan Kouru, and by the Chinese, 'Tehong-koué, the last name meaning the Central Kingdom (*Duhalde, Hist of China*, p 1) According to M Huc, the Chinese also give to their country the names of 'Tchoung hoa, or, flower of the centre, of Tien chao, the celestial empire, or heaven's empire, and of Tien-hia, the "Beneath the Heavens," or the world, as the Romans called their dominions Orbis The most ancient name given to their country by the Chinese, and that most in use, is Tchoung-kouo, that is to say, the Empire of the Centre (*Huc Chinese Empire, Vol I, page 349 & 350*) It is also, however, called by the natives Tang shan, the hills of Tang (the name of one of the most celebrated dynasties), the present reigning family has given it the name of Tatsung-kwo, the empire of great purity In government proclamations, especially in those addressed to Barbarians, it is often called 'Tien chaon, the "Celestial Empire," the natives call themselves Chungkwo-teih jin, men of the middle kingdom, or Han-jin, or

Tang-jin, men of Han or of Tang (from the dynasties of those names) (*Gutzlaff's Chinese History, Vol I, p 20*) The name of Sereis, which Horace and the ancients use, seems to have been strictly applicable to some nation in the west of China. The western term China is not traceable, but many authors have surmised that it was given to the country when the Tsin dynasty carried their aims to the west. Whatever may have been its origin, the term China (Cheena) was that early given by the people of the N W of India, to the nation which Europe now calls the Chinese.

The annals of this empire extend back for three or four thousand years. Fo-hi is the first named sovereign of the Chinese, but the date of his reign is not ascertained. Yu, the Great, is the first monarch of whose reality there is no doubt. Then Bambus-book contains the record of the ancient imperial dynasties from B C 1991, to A D 264. The chronological connexion of its early dynasties is as under:

1st dynasty, Hia, the first emperor, Yu, beginning B C 1991, reigned 432 years.

2nd dynasty, Shang, began B C 1559, lasted 509 years. Twenty eight reigns in fifteen generations.

3rd dynasty, Tsheu, began B C 1050, lasted 55 to 479 years. The 12th emperor Yeu Yang began to reign B C 781. His sixth year was B C 776. Confucius lived under this dynasty, and he recorded the observations of the solar eclipses from B C 481 upwards to 720.

4th dynasty, Tsin, began B C 255, and lasted to 207, 49 years.

5th dynasty, Han, began B C 206, and lasted to A D 264, a total of 469 years.

Systematic Chinese history hardly goes back so far as B C 2000, i.e., to the reign of Yu. Yu was the founder of the dominion of the kings or princes of Shen si in S China, as far as the great river. He diverted the course of the Yellow River to fertilize the lands between the two rivers.

Prior to the first emperor Chi-hoang of the Tsin dynasty, about 200 years before the Christian era, the country had been subdivided into numerous principalities and commonwealths, but that warrior emperor brought them all under subjection, and it is supposed to be from his time that the country was called China, from Tsin or Chin, the name of his dynasty. It was this emperor, also, who built the Great Wall to keep off the incursions of the Tartars. It was done by forced labor, every third labouring man was compelled to work for his bare food as a remuneration. It extends from the sea to the most westerly province of Shin-see, about 1,500 miles. It was built of earth faced with brick, it crosses

mountains, valleys and rivers, and was finished in five years. Its breadth admits of six horsemen riding abreast, and has a tower every hundred yards. It was Chi-hoang-ti who introduced yellow as the colour of the royal family.

The Tsin dynasty was overthrown by Lin-pang, of the Han province, who was the first of the Han dynasty. With the destruction of the Tsin dynasty, great injury resulted to the Chinese annals. Most of the Han princes were munificent patrons of literature. During the reign of Ming-ti, the 15th of the Han dynasty, considerable intercourse was carried on between the princes of India and China, but it was particularly during the dynasties of Sum, Leam and Tam, from the fourth to the seventh centuries, that the princes from Bengal and Malabar to the Punjab sent embassies to the Chinese monarchs. The dominions of these hindu princes may hereafter be identified — (*Tod's Rajasthan, Vol I, p 218*) Nevertheless our own times, the Ming and Tsing dynasties ruled from A. D. 1368 to the middle of the 19th century.

*Origin and early history* — There are two great races occupying the Chinese Empire, Chinese and Tartars, the latter being the ruling people. All the ancient traditions of the Chinese refer to their emigrations from the West, and they undoubtedly are an aboriginal race from the original home of man. Like the Egyptians they seem to have migrated from the original seat, prior to the flood of Noah, of which neither race have any tradition. The first settlement of the Chinese people was in the northern portion of Chih-le, the province in which the present capital, Peking, is situated. How the first Chinese, the founders of the nation, came to be in that locality, is one of those questions connected with the origin and spread of the human race generally which can only receive a conjectural solution. All we do or can know positively is, that the first portion of authentic Chinese history tells us that Yaow, who reigned 4,200 years ago, had his capital at the new district city of Tsin-chow, situated about 100 miles only to the south of the present capital Peking. From this most ancient location the people spread gradually westward and southward, thus steadily increasing its territory. The usual course of the process was, first, colonization of the newer regions, and displacement from them of whatever aboriginal inhabitants were found, and afterwards political incorporation with the older territory. At times, however, the process was reversed, and military conquest of the aboriginals preceded their displacement by an industrial occupation of their lands. The territorial distinction marked by the terms, China Proper and the Chinese empire, has existed in fact from the earliest periods of Chinese history. China Proper means at all periods that portion of the east of the Asiatic continent which has been possessed and permanently occupied by the Chinese people. The Chinese empire means at all periods besides China Proper, those large portions of the whole Asiatic continent occupied by Tartar-nomades or other non-Chinese peoples, but which have from time to time been under the sway of the Empire of China, and more or less directly ruled by Chinese officers and armies. China Proper has at all periods been characterized by Chinese civilization, that is to say, its population generally, besides being physically of the same race, has always been governed in its domestic, its social, and (with the exception of some very short periods) its political, life by the principles and rules laid down in the Chinese old Sacred Books. The non-Chinese peoples of the Chinese empire have, on the other hand, at all periods, either been destitute of anything that could be called

civilization, or have been slightly tinged with Chinese civilization, or have been marked by some different civilization, as, for instance, at present, in the inhabitants of Turkestan by a Mahomedan civilization, and the inhabitants of Tibet by one strictly budhistic.

*Extent* — The Chinese empire as thus defined has in the course of ages varied greatly in extent. It has been more than once larger than it is even now. It was so for example, about 2,000 years ago, under the fifth emperor of the Han dynasty, when it embraced the greater portion of inhabited Asia west of the Caspian sea, and inclusive of Siam, Pegu, Cambogia and Bengal. In the intervals between these great extensions it has shrunk up to the size of China Proper, and even this latter has been occasionally subdivided for considerable periods under two or more ruling families or dynasties, each acknowledging no superior. But the Chinese people has continued the same, even when under several rulers, and has been steadily increasing its territorial possessions by the processes above described. (*T. T. Meadows' Chinese and their Rebellions An Essay on Civilization, p 34, 35, 36*)

The Chinese have annexed all the parts neighbouring on China Proper, from Mantchu and Mongol races. The dynasty is Mongol and the army Mantchu, and furnishes Mantchu soldiers in Mongolia, Tibet, and Kumaon. China Proper, without including Chinese Tartary, and other dependencies, is the largest as well as the most compact country in any part of the globe, extending, in length, from about  $19^{\circ}$  N to about  $42^{\circ}$  N, and in breadth (taking one extremity, where it borders upon the peninsula of the Corea), from about  $125^{\circ}$  E, (taking the other extremity, where the Great Wall extends to the west), to about  $85^{\circ}$  E, being  $23^{\circ}$  in latitude, and  $39^{\circ}$  in longitude. The area given by Sir George Staunton is one million two hundred and ninety-two thousand miles — (*Sirr's China and the Chinese, Vol I, p 407*)

*Population* — According to Mr Knowlton's views, in 1868, the census of 1839, as given by M. Sacharoff of the Russian embassy in Peking, made a population of 415,000,000. A census was found in governor Yeh's Yamun at Canton and the Chinese Commissioners at Tien-sing in 1859, stated the population at 400,000,000. China thus possesses a third of the human race, twice the population of British India with its feudatories and seven times that of Russia. China Proper is divided into 18 provinces, which have a population of 280, to the square mile, while that of Britain and Ireland is only 260. The antiquity, peace

and fertility of the country has given this great populousness

*Civil Government*—The government is conducted by the Nuy-ko or Interior Council Chamber, in which there are four chief councillors, two of them Tartars, and two Chinese, who bear the titles of Choung-thang and Kolaou. The Tartar minister presides. The Loo-poo are six boards for the conduct of government business, and the provinces of the country are each under a governor, or, where two provinces are united, a governor-general. Every province is divided into a certain number of districts, called a "Fu," "Ting," "Chow," and "Heen." A "Fu" is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government. A "Ting," a smaller division than, and sometimes a portion of, a Fu, when separate it is governed as a Fu, and called a "Chuh-le." A "Chow" is similar to a Ting, as also a Heen, but each is a smaller division, each Fu, Ting, Chow, or Heen, has one or more towns, or walled cities, under its guidance, one of which takes its name and rank as "Kwang-Chow-Fu" and "Shang-Hae-Heen," which latter, although of that subordinate rank, is the largest maritime city in the empire, and the greatest resort of the native ships or junks—(*Forbes' Five Years in China*, pages 10 & 11)

*Provinces*—*Pe che le* has Chinese Tartary on the N., Honan on S.W., Imperial Sea and Shan-tung on E., and Shan-se on W. *Shan se*, one of the smallest provinces, resembles in form an oblong lozenge, and is bounded on the N. by Tartary, on the S. and S.W. by Honan, on the E. by *Pe-che-le*, and on the W. by *Shen-se*.

*Shen-se* was one of the most extensive provinces, but the western part of it has been erected into a province under the name of *Kan-su*.

*Kan-su*, the western portion of the old province of *Shen-se*.

*Sze-chu-en*, formerly called *Si-shu*, is bounded on the North by *Shen-se* and *Kan-su*, on the South by *Yun-nan*, on the East by *Hon-an* and *Hoopih*, and on the West by *Thibet*, or rather by a small strip of Chinese Tartary. It is by far the most extensive of all the provinces, containing by estimation 175,000 square miles and having a population of 22,000,000. The *Yan-tsze-Kang* river traverses its whole extent, and to it all other numerous streams of the province are tributary.

*Yun-nan* is bounded on the North by *Sze-tuen*, on the South by *Laos* and *Tonquin*, on the East by *Kwan-se* and *Hon-an*, and

on the West by the *Burman* empire, a small portion of the north-west is bounded by *Thibet*. The surface of this province is estimated at 57,000 square miles, and its population at seven millions.

*Kwan-se* is bounded on the North by *Hon-an*, and an irregular chain of lofty mountains, on the South and East by *Kwan-tung*, on the West by *Yun-nan*. Its surface is estimated at eighty-seven thousand square miles, and its population is between seven and eight millions. *Kwy-ling foo*, its capital contains eleven cities of the first class, twenty-five of the second class, and 170 of the third class.

*Kwan-tung*, or *Yue tung*, which signifies the "Eastern breadth," extends along the Southern coast from the centre of the Gulf of *Tonquin*, nearly as far as the portion of the coast which is opposite the Island of *Formosa*.

*Foo-keen* lies on the coast, and is bounded on the North-East by *Che-keen*, on the North-West by *Ke-an-se*, and on the South-West by *Kwan-tung*. Its surface is estimated about fifty-seven thousand square miles, and its population is above fifteen millions.

*Che-keen* is bounded on the North by *Keang-soo*, on the South by *Foo-keen*, on the West by *Keang-sea*, and *Gan-hwuy*, and on the East by the ocean, its surface is estimated at fifty-seven thousand square miles, and its population is upwards of twenty six millions.

*Keang-se* is the eastern portion of the ancient province of *Keang-nan*, or *Nan-kin* as known to Europeans, this ancient province was estimated to embrace a surface of 81,000 square miles, and its population was seventy millions. *Keang-se*, in extent, is about three-fifths of the ancient province, and its population is upwards of thirty-seven millions. The Imperial Canal traverses the whole extent from north to south and the *Yang-tsze-Kang* from east to west, affording ready means for the transmission of merchandise, to and from all parts of the empire.

*Gan-hwuy* is the western division of the ancient province of *Keang-nan*, being composed of about two-fifths of that province.

*Shan-tung* is in the form of a long peninsula, extending towards *Corea*, dividing the Gulf of *Pe-che-le* from the Yellow Sea, it is bounded on the north west by *Pe-che-le*, on the south east by *Hon-an*, and on the south by *Keang-se*. Its surface is estimated at 56,000 square miles, and the population is nearly twenty-nine millions. Besides grain, this province supplies large quantities of fish, a great portion of which, packed in ice, is sent to *Pekin* by the Imperial Canal.

*Hon-an* is bounded on the North by *Pe-*

che-le, on the South by Hoo-pih, on the East by Gan-hwuy, and on the West by Shen-se, it is also called by the Chinese Tong-hoa. The capital is situated on the south bank of the Hwang-ho, which flows through the whole breadth of the province.

Hoo-pih is the northern division of the ancient province of Hoo-kwang, and is bounded on the North-West by Shen-se, on the South-East by Ho-nan, on the East by Gan-hwuy, and the West by Sze-chu-en. Its population is about twenty-seven millions.

Hunan, the southern division of the ancient province of Hoo-kwang, is larger than the northern portion just described, but it is not so thickly populated.

Keang-se is situated immediately to the east of the last described province, and is estimated to contain 27,000 square miles, and its population is upwards of thirty millions. Kwei-chow is bounded on the North by Sze-chu-en, on the South by Kwang-se and Yun-nan, on the East by Hu-nan, and on the West by Sze-chu-en. This province is estimated to embrace a surface of 64,500 square miles (*Swi's China and the Chinese, Vol I, p. 423*).

*System of Government and Secret Societies*—The emperor has, in his palace a bell for the use of the oppressed who claim his protection, but it is now as much off duty as the cymbal or drum of the mandarins (*Huc Chinese Empire, Vol I, p. 358*). The idea of the family is the grand principle that serves as the basis of society in China. Filial piety, the constant subject of dissertation to moralists and philosophers, and continually recommended in the proclamations of emperors and the speeches of mandarins, has become, in the views of the Chinese, the fundamental root of all other virtues. All means are made use of to exalt this sentiment, so as to make of it an absolute passion, it assumes all forms, mingles in all actions, and serves as the moral pivot of public life. Every crime, every attempt against the authority, property, or life of individuals, is treated as filial disobedience, whilst, on the other hand, all acts of virtue, devotion, compassion toward the unfortunate, commercial probity, or even valour in battle, are referred to filial piety, to be a good or a bad citizen, is to be a good or bad son. The emperor is the personification of this grand principle, which dominates and penetrates more or less deeply all the strata of society, in this immense agglomeration of four hundred millions of individuals. In the Chinese language he is called *Hoang-te*, August Sovereign, or *Hoang-chou*, August Elevation, but his name *par excellence* is *Tien-tzu*, Son of Heaven.

But in the bosom of this septic and avaricious people, there has always remained a powerful and vivacious spark that the Tartar government has never been able to extirpate, and secret societies have been formed all over the empire, the members of which have seen with impatience the Mantchu domination and cherished the idea of overthrowing it to obtain a national government (*Huc. Chinese Empire, Vol I, p. 13, 84*).

No nation is more closely united by the ties of clanship which they designate by the word *sing*, than the Chinese. All the many millions are divided into rather more than 400 *sing*, those who belong to the same *sing*, consider each other as relations, descended from the same ancestor, and bound in duty to lend mutual help. This excellent custom degenerates frequently into that exclusive partiality, which is so repugnant to the spirit of true philanthropy. One *sing* is opposed to the other, one clan oppresses the other, they proceed even so far as to engage in open hostilities. The ties of nearer relationship are still closer. A Chinese is taught by his sages to love his relations (*Gutzlaff's Chinese History, Vol I, p. 207*).

*Civil Government*—The entire government is under the direction of two councils, attached to the person of the emperor, the *Nei-ko*, and *Kiun-ke tchou*. The first is charged with the preparation of plans, and the despatch of current business. Its duty is, according to the official book, "to put in order, and to make manifest the thoughts and designs of the Imperial will, and to regulate the forms of administrative decrees." It may be regarded in some measure as the secretariatship of the empire. The second council, named *Kiun-ke tchou*, deliberates with the emperor concerning political affairs. The Chinese distinguish, first, the great prefecture named *Fou*, which have a special administration under the inspection of the superior government of the province, secondly, the prefecture called *Tcheou*, the functionaries of which depend some times on the provincial administration and sometimes on that of the grand prefecture, and, finally, the sub-prefecture *Hien*, below both the *Fou* and the *Tcheou*. Each of these three, the *Fou* and *Tcheou*, and the *Hien*, possess a kind of chief town.

*Literature*—The greatest counterpoise of the Imperial power consists of the literary aristocracy, or corporation of men of letters, an ancient institution, which has been established on a solid basis, and the origin of which is at least as early as the eleventh century before our era. It may be said that the administration receives all its real and direct influence from this sort of literary oligarchy. The

emperor can only choose his civil agents among the lettered class, and in conformity with established arrangements Every Chinese may present himself for the examination for the third literary degree, and those who obtain this, may then become candidates for the second, which opens the way to official employment To fill the higher offices the prize must be obtained in the competition for the first degree The corporation of lettered men recruited every year by the method of examination, constitutes a privileged class, almost the only nobility recognised in China, and it may be considered as the chief strength and nerve of the empire

*Nobles* Of the twelve orders of the Imperial nobility of China, tsinw' u is the first, kinwang the second, beileh, third, beitseb, fourth, chin kwoh kung, fifth, f-kwoh kung, sixth

Hereditary titles only exist for the Imperial family, and for the descendants of Confucius, who are still very numerous in the province of Changtong To the hereditary titles which the relations of the emperor enjoy, there are attached certain prerogatives, as well as a very modest allowance, the right of wearing a red or yellow girdle, of putting a plume of peacock's feathers in their caps, and of having six, eight, or twelve bearers to their palanquins They cannot, more than any other citizen, pretend to any public office, without having previously taken their literary degree at Peking and Moukden, the capital of Manchuria These Tatar nobles are often seen living in idleness and penury on their small pensions, and having no other proof to show of their illustrious origin than the red or yellow girdle A private tribunal, however, is charged to govern them and superintend their conduct

The first civil and military mandarins who have distinguished themselves in the administration or in war, receive the titles of *koung*, *heon*, *phy*, *tze*, and *nan* All the officers, civil and military, of the Chinese empire, are divided into nine orders, *Mhouping*, distinguished one from the other by certain buttons, or rather balls, of the size of a pigeon's egg, which are worn above the official cap This distinctive ball is of plain red coral for the first order, of carved coral for the second, of a transparent deep blue stone for the third, of pale blue for the fourth, crystal for the fifth, of some opaque white stone for the sixth, and for the seventh, eighth, and ninth, of gilt and wrought copper Every order is subdivided into two classes, the one active and official, the other supernumerary, but this makes no difference in the balls All the official personages comprised in these

nine orders are designated by the generic term of *kouang-fou* The name of mandarin is unknown to the Chinese, it was invented by the first Europeans who visited the country, and is probably derived from the Portuguese word '*mandar*' to command, which they made mandarin The famous Imperial academy of *Han-Lin* is composed of literary graduates, it furnishes orators for the public festivals, and literary examiners for the province, and is supposed to promote the cause of learning and science generally (*Hue Chinese Empire, Vol I, pp 19, 87, 89, 90, 95*) But the people of Europe, where the press teems with new publications, may be astonished to learn that amongst 400 millions of men, there is not one original writer, nor has there been any for many centuries The essays of successful literary candidates are almost the only new publications which see the light, and these contain nothing but what many millions before them have written under similar circumstances

*Races* Of the three great races, Chinese, Mongol and Mantchu, the predominating color of the skin of the Chinese is yellow, but yellow, brown, and sometimes a maroon tint occur The face is broad and flat cheek bones projecting, nides black eyes oblique beard scanty, stature above that of the Malay and Tibetan, below that of the European The sea-coast people are skilful and enterprising, with that self-reliance which enables nations to emigrate, and we find them swarming in the Malay ports, in Singapore, Borneo, and the Philippines, and numbers are in Australia, the West Indies, Sandwich Islands, and California, but, except in buddhist Burmah, they are not settlers, only forming temporary connections, sending all their savings, and looking forward to return to their native land Next to the Malay this people are the most formidable pirates of the eastern seas The Mongols and Chinese have scanty beards.

*Feudatories* The numerous military feudatories of the empire are scattered through the regions known to the Chinese geographer as Inner and Outer Mongolia, Uliasutai, and Tsing Hai, or Koko-Nor, but there are also the troops of Tibet under the resident Minister of that country The tribes acknowledging the sway of China are divided into Inner and Outer Mongolians. The former occupy the region to which their name refers them, the latter, all the other tracts and districts above mentioned

Inner Mongolia, lying between the Desert of Gobi and the continuous frontier of Manchuria and China, was occupied, in

1812, by 24 tribes, differing in name, irregularly ranged under 49 standards, and divided, in uneven proportions, into six *chalkan*, or leagues

The Outer Mongolians were, 1st, four tribes of Kalkas of different names, under khans, which, with two fragmentary tribes attached to them, formed four leagues, they numbered in all eighty-six standards, and resided in the territory north of the Desert of Gobi, geographically named Outer Mongolia, 2d, Eleven tribes, not in leagues, under 34 standards, scattered to the west of the Hulan mountains, in the south-west of Inner Mongolia, to the south of the Altai, and to the north of the Tengkirmanges, 3rd, Two tribes of mohammedans, under two standards at Hami and Tufan, within the provincial boundaries of Kansuh, south of the Celestial Mountains, and 4th, Five tribes under 29 standards round Koko-Not, called by the Chinese Tsing-Hai, or Azure Sea. There are lamas of both Inner and Outer Mongolians. Nearly every standard of the above, if not all, has a native head entitled a Dzassak, whose chieftainship is, with slight limitations, hereditary, the people under their rule are collectively styled *orbadu* or *orpatu*, the lamas excepted, who are distinguished as of Shapi Nor, their Dzassaks take the prefix *lama* before their title. The few tribes, or remnants of tribes not under such chieftains, are under the more immediate authority of the Banner generals and resident Ministers from China. These last may be briefly enumerated. Under the Tsangkiun of Sui-yuen are the Tümet of Shansi beyond the Wall, under the Tutung at Kalgan, on the Wall, the most privileged tribe of Chahar, Bargou incorporated in Chahar, Kalkas and Eluth, under the Tutung at Jeh ho, Tashtava Eluth, under the Fututung at Hurun-pir, Eluths and New Bargou, under the Tsung-kwan at Tasangula, Solon, Taguri, Orunchun and Pilar, paying peltry, both these being under the Tsangkiun of Sagalien. In Ih, the Tsiankiun has authority over Eluths and Chahars of his own central province of Ih, who have also Chinese ministers, over Eluths, Chahars, and Hassacks under the Tstantsan Minister resident at Tarbagatai, and over the mohammedans of the eight cities in Ih, south of the Tien Shan, who are under resident ministers of different degrees.

In Uliasutai province, which receives a small garrison from the Tsangkiun of Shansi, there are Tangnu Uriankai, some of them Yaiuh herdsmen, some Tasang peltry-men, under the Tsangkiun in observation at Kurun, who is father supreme over the Ministers at Kobdo, having charge of the Mingats, Eluths, Chak-

sim, Altai Uriankai and Altai-Nor Urian-kai of the far province.

On the borders of Tibet, are Tamuh, or Dam Mongols, under eight standards, amenable to the authority of the resident Tantsan.

As to the feudal constitution of these tribes, (*Wade's Chinese Army*, page 68), the six ming, *chalkan* or leagues, into which these twenty-four tribes are formed, are each under a head or elder, and a lieutenant, chosen from a list of Dzassaks presented to the emperor by the Colonial Office. Every tribe is bound to assist any other in the same league which may be in danger. Once in three years, the leagues are mustered by four high commissioners selected by the emperor from incumbents of high civil and military posts in the empire, then visit is of a thoroughly inquisitorial character. The Dzassaks are in turn compelled to pay visits to Peking, the year in which it is not the duty of this or that Dzassak to go, he sends a Taikib. On stated occasions, all assemble in court costume to do homage in token of fealty before the door consecrated to Majesty at the head quarters of the tribe.

The internal economy of the Outer, is much the same as that of the Inner Mongolians. Their Dzassaks are ennobled by all the same titles except *Tapunang* of which there are none. Some of the Dzassaks, whether otherwise ennobled or not, have the title Khan, which is superior to any of the rest, and brings with it a higher allotment of pay and gifts. Their *chalkan* or leagues, have each a captain-general, and a lieutenant like the Inner Mongols, and are like them mustered and inspected triennially. Their military organization is, with a few exceptions, the same. First, in the region of Outer Mongolia, we find four leagues of Kalkas, each under a khan. 1st, the Tuchetu khvate, numbering 20 standards under 58 tsoling, 2nd, the Sain-noin 24, including two Eluth standards, in 38½ tsoling companies, 3rd, the Tsetsen, 23 standards in 46½ companies, 4th, the Dzis-saktu, under 19 standards, including, of Khoits in 24½ companies. Now come the Durbet in two wings, each of which is a league under a lieutenant general, appointed as above. The left comprising ten standards of Durbets and one of Khoits, in 11 companies, the right, three of Durbets and one of Khoits, in 17 companies. Their position is beyond the north-west frontier line of the Dzassaktu, they extend across the province of Kobdo north of the city of that name, and their troops, amounting in 1812 to 1400 *makra*, were under the *Tsantsan* of the Chinese government at Kobdo. The two

wings are subject to one khan Under the same officer of Kobdo, are the troops of the New Turguth of the Urungu River, in the south-east of the same province, and Hoshoit of the Djabkhan farther north The former under two standards in three companies, which would give but 150 makia, form a league, the single standard and company of the latter, furnishing 50 makia, belong to none

Under the Kurun general are 595 Tasang families of Urianku Tangnu, paying two skins of marten fur, and 412 paying 80 gray mouse skins under the Tsantsan of Kobdo, 412 of Altai Tangnu, paying gray mouse skins, 256 marten skins, and 429 paying four fox skins each also 61 of Altai Nor Tangnu paying gray mouse skin, and 147 paying marten fur Of Yumuh there are, under the general, eight companies of Uriankai, and under the Tsantsan, seven of Altai, and two of Altai Nor

Of the leagues whose soldiery is under command of the Tsiangkiun of Ih, of whom some mention has been made before, there are four of Old Turguths and one of Hoshoits distributed in five circuits. The north contains the Old Turguths of Hopoksiloh, three standards in 14, the east, those of Tsihrholang, two in 7, the west, those of the River Tsing one, in 4 companies. These are north of the Tengki, stretching well into Tarbagatai.

Following the outline of modern Kansuh, we find in the north-east of the Tsing Hai, or Koko-Nor territory, five tribes in one league of 29 standards, it is peculiar in having no captain or lieutenant like the rest. Their standards are 21 of Hoshorts in 80 companies, one of Khoorts in 1, four of Tuiguths in 12, one of Kalkas in 1, and two of Choros in 6½ companies. Their fighting strength in 1812, would thus be 5025 makia, under the command of the Resident at Si-nung, on the borders of Kansuh.

The mahommedans of Hami and Turfan as well as those of the cities in East Turkestan, have been noticed in the Kansuh and Ili commands. The tribe of Hami has one standard in 13, Turfan, one in 15 companies, or respectively 650 and 750 makia, under the Dzassak, who are overseen by a lingtsui at each place, under the tutung of Urumtsi as chief.

The nobility of these are under the same obligations of homage and service as in the preceding tribes. There appears to be some fiscal distinction between the mahomedans of Hami and Turfan, and those of Ili and the cities in the South Circuit of Ili, or Turkestan, who are mentioned as families pay-

ing a tribute or tax of produce, from which none are exempt but the soldiery. The only indigenous troops returned in the Digest, however, were 500 inahomedans at Cashgar, in 1812, the chief of the circuit cities, over these there is a tsungkwan, a fu-toung-kwan, and 5 pihchang centurions. Their garrisons of Banner men and Lubyng were given before.

Tabular Statement of the Population and Armed Proportion of the Tribes (1812)

Divisions and Grades		Tribes in Inner Mongolia									
		Kalkas &c of Outer Mongolia under the general at Kurun	Old Turguths under the Tsaang-khun of Ili	Hoshots of Chutuzang under the Tsaang-khun of Ili	New Turguths of Dzungu and the Ijibkhan Hoshots	Durbets and Khorits under the Minister at Kob-da	Koko Nor tribes, ruled from Sining-fu in Kansu	Alashan Mongols, under their own Dzasaks	Old Turguths of Edaine, under their own Dzasaks	Mohammedans of Ham, under their own Dzasaks	Mohammedans of Turfan under their own Dzasaks

There are many small scattered tribes. Amongst these are the nomad Yu-muh, wandering herds, they and the Tosang, slayers of bird, beast, or fish, the skin or flesh of which is paid by them as tribute, are variously interspersed throughout the military jurisdictions of extra-provincial China, and are administered more or less by military functionaries. The Tasang are to be found in Kirin, and Tsitsihar of the Manchurian provinces, and Urianghai, the Yumuh are at Changkiakan, and in Ili, Jeh bo of the map, Tarbagatai, Urianghai, Kobdo, and Tibet, there are also Yu-muh between Tibet and the Kansuh frontier, under the minister residing

at Si-ning-fu, and on the borders of Shan-si in the Kwei-hwa command. According to the rule of collection among the Urianghai tribes, a marten skin shirt is made up by payment of ten fox skins, one of the latter, by payment of half a tael. At this rate, the Kirin peltry would be worth 11,990 taels, that of Tsitsihar, 44,970 taels. We cannot say what allowances are made to the tributaries. The Sang-ting of Ta-sang Ula, mentioned above, render every Chu-hien, 16 pearls, or 1760 pearls in all, to the Kwang-chu-sz, or Household treasury, 5,000 catties weight of honey, to the Household Kwinling, 1,000 fir cones for fuel, and 54 Shih, peculs or fit-nuts to the Household Ch-ng-i-sz, office of ceremonies, banquets, &c. There is no fixed due of fish, what is collected goes to the Chen-fang, or Imperial buttery. The cost of the collection will be found to be above 40,000 taels, exclusive of the salaries of the Tsungkw-n and other officers, what may be the value of the tribute, we have no data for computing. The honey collected by the Sang-ting is worth but 40 catties a tael. These Sang-ting are scattered through 14 magisterial districts on the north of Chihli, and beyond its border in Shing-king-fu, the old, 965 families, pay a tax amounting in all to 4214, the new, 1116 families, 8071 taels, or an equivalent in kind of fowls, deer of different sorts, wild boars, hares, pigeons, quails, wild ducks, herons, small scaled fish (trout?), hawks and falcons, ravens, honey, deers' flesh, osprey feathers for arrows, fox-skins, and seal skins. They are divided into classes according to the tribute required of them, if the land under their tillage do not render sufficient. The new families should pay about 0.35 of a tael on very Hiang, or 6 Chinese acres. The total extent in their hands is about 137,560 acres. They and the old are under the civil authorities of the districts in which they abide.

The nomads of the Sagalien river and island of Tarkai, in the province of Kium, are not registered in Chuhien or Tsoing companies. In 1812, they were 2398 families under 56 surnames, of the Heiche, Fayak, Kaye, Orunchun, and Kelur tribes held to be within the jurisdiction of the Tutung of Sansing, each family paying a tribute of one marten skin.

Maou-tze on the south of Szechuen are said to be wild mountaineers, but much connected with them is obscure. Friar Odoric travelling in China notices the differences between the races on the two sides of a great mountain, from which the friar seems to have passed a part occupied by the Meau-tse or other aboriginal tribes. These do not now extend so far east, but what Polo

says of savage cannibals with blue-painted (i.e. tattooed) faces in Fokien seems to imply that they did so in his time, and some observations of Sir John Davis corroborate this (Polo 178 *Chinese. Supp. Vol. p. 260*). And in the modern Chinese census one class of the population in a district of the province of Canton appears as Blacks (*Chin. Mod. p. 167*). Indeed Semedo (about 1632) says there was still an independent kingdom, presumably of the Meau-tse, in the mountains dividing Fokien, Canton, and Kiangsi, viz. those of which Odoric speaks (*Rel. Della China, p. 19*). The habits and appearance of those races would, no doubt, stand in strong contrast to those of the Chinese, who call them Dogmen and Wolfmen. The "barrel of horn" worn on the head may perhaps be identified with the grotesque coiffure of the Meau-tse women, described by Duhalde as "a light board, more than a foot long and five or six inches wide, which they cover with their hair, and fix it with wax so that they seem to have a hair hat on. They cannot rest the head nor lie down, except by putting something under the neck, and they are obliged constantly to twist the head right or left in passing along the forest paths. And the business of combing the hair is a still greater difficulty: they must then hold their heads for hours by the fire to melt the wax," etc. *Yule Cathay. I. p. 111*. The *Army of China* consists of the Bannermen who may be said to be the force of the usurping family, and the troops of the Green Standard, who are, with occasional exceptions amongst the officers above the rank of subaltern, entirely Chinese. The Bannermen are Manchus, Mongol Tartars, and Han kium, or Chinese descended from those who forsook the cause of the Ming when their country was invaded. These three nations are each ranged under Eight Banners as below, the three first being styled the Superior, the five lower, the inferior Banners.

- |                   |                 |
|-------------------|-----------------|
| 1 Bordered Yellow | 5 Plain Red     |
| 2 Plain Yellow    | 6 Bordered Red  |
| 3 Plain White     | 7 Plain Blue    |
| 4 Bordered White  | 8 Bordered Blue |

The 1st, 3rd, 4th and 7th form the left, the remainder the right wing. The chief superintendence of all Bannermen vests in the metropolitan office of the Tu tang, or Captains general of the Banners. The Chinese army not of the Banner, is known as the Luh ying, or that of the tents of the Green Standard, a designation bestowed on it to distinguish it from the Banner corps. The Inquiry, &c. of 1825, makes 41 principal divisions of the Banner forces, stationed in Peking and a section of Chihli round it, and in eleven of the other provinces of China Proper, Man-

churia, and Turkestan. There are no Banner-men in Nganhwui, Kiangsi, Hunan, Kwangsi, Yunnan, or Kweichan. The troops of the Green Standard are divided into 1202 ying, battalions or cantonments, of which there are but five in Peking, under the command of the Captain-general of the Gensdarmery. These ying vary widely in strength, and a number of them, also differing in different places, compose a "piau," of which there are 43, or a "chinpiau" of which there are 72, in the eighteen provinces. M. Huc speaks of these (*Vol. I, p. 404*) as estimated at 500,000 strong. All the Banner garrisons save those of Fuhchau, Canton, Laangchan, Ninghua, Chiwanghang, Sui-yuen, Tai-yuen, Tehchau, and the nine inner garrisons of the Metropolitan Cordon, send up a small number of officers and men to Peking to be there taught their duties in the hunting suite of the Emperor, should he repair to the preserves of Muh-lan, at Jeh-ho (Zheho). These are in the keeping of a Tsungkw in (3a) two yihch ing (4a) eight fong-yu (5a) and eight mau-ki kau, or subalterns all under the orders of the tutung of Jeh ho.

There is a rollster of the Mongolian nobles who are obliged to present themselves every year at Peking. If the Emperor cross the border to hunt, they do him homage at his hunting-ground instead, and the expedition is under the conduct of some of them, while the rest attach themselves to his suite while it lasts.

The Tsohing, in 1812, were 57,—viz., of the Kharchin nomades 7, Orat 3, Sumit and Isuth 1, Mau-mingan 4, Kalkas 3, Bargow 15, Old Eluth 18, and 6 of the new, or Eluths reclaimed since 1754, all distinguished as belonging to the Chahar country. There is at Chahar also a large quasi-military establishment for the care of the oxen and sheep of the pasture — *Wade's Chinese Army, p. 3 to 48*.

The number of Mantchoo troops is estimated at 60,000 men. These soldiers, we believe, are habitually under the arms, and are assiduously exercised in their profession. The government watches over them with great anxiety, for the Emperor has a strong interest in not allowing these troops to stagnate in inaction, he takes care that they shall preserve something at least of the warlike character to which they owe their conquest of the empire — *Huc Chinese Empire, Vol. I, page 404*.

*Religions and Philosophies.* The Chinese have acquired in the course of their long existence, more than one different kind of philosophy, that is to say, there exist in China several radically different ways of viewing the nature of the inanimate world and of man.

There are about 800,000 christians in China, and many thousand mahomedans. The philosophic systems of Lao Tse, of Kung Tse, or Confucius, of Tshu hi and of Buddha, take the place of religions, but none of these four are pure philosophies.

Lao-tse, also called Lao kiun, was born in the year B.C. 604, and died B.C. 520 at the age of 84. Confucius was born B.C. 551, and died in B.C. 479, at the age of 72, and they were contemporaries and acquaintances. Lao Tse regarded Tao as the Rational Order of the Universe, as the first cause of all things. Tao means *way, kind, mode*, and in his views, the wise man renounces the world and plunges himself into non-existence. Lao-tse himself forsook his official functions and the world and died in a desert. Confucius repaired to him near the close of his life, but was received with a sharp rebuke for his ambition and love of money and estates, and ridiculed for his researches into the ancient ceremonial. The mystical formulas of Lao tze have never found their way amongst the practical Chinese. His adherents fell into the delusions of a mystical magic. His system of philosophy is regarded by its adherents as the primitive one of the most ancient inhabitants of China. It has numerous analogies with that of Confucius, but the individual existence of genii and demons is recognised in it, independently of the parts of nature over which they preside. The priests and priestesses of this worship are devoted to celibacy, and practice magic, astrology, and necromancy, they also study alchemy, and profess to have discovered the philosopher's stone, or secret of making gold, and a liquid that renders those who imbibe it immortal. The tenets enunciated by his followers, the priests of Tao, are the practice of virtue, repression of animal passions, the insufficiency of wealth to procure happiness, and the fallacy of seeking after perfect bliss. The spirits of darkness and demons are worshipped, sacrifices being made to them of three descriptions of victims, which are a hog, a cock, and a fish, and the chief priest of this sect professes to have power over the gods and demons of the invisible world. In fact, the sect of Tao may be called the mystics of China, as they profess alchemy, the art of divination, and pretend to great knowledge. They are called Tao-tse, or Doctors of Reason, because their fundamental dogma taught by the renowned Lao-tze, is that of a primordial reason, which has created the world. This doctrine is contained in a work pompously entitled, the "Book of the Way and of Virtue." Lao-tze was in frequent communication with Confucius, but it is difficult to know what was the opinion

of the head of the Religion of the Lettered concerning the doctrine of the patriarch of the Doctors of Reason. One day Confucius went to pay Lao Tse a visit, and when he came back to his disciples, remained three days without speaking a word. Whatever may be said of the philosophical ideas of Lao tze, his disciples have never enjoyed great popularity. There is not a popular belief. They are gross idolaters. To enumerate all their idols, would be a very task, amongst them are San-ting, the three pure ones, Shang-te or Yuh Hwang, the supreme august one, Pih te, the northern emperor, &c. Laou keun's work, the Taou-tih king, is still extant.

Confucius was born in 551 B. C., and died in the year 479 B. C., at the age of 72 or 73. During his lifetime, the country now known as China was parcelled out into a number of independent States and Commonwealths. He was the son of the chief minister at the court of the king of Loo, and was himself of royal descent. He rose to the dignity of minister of that kingdom, and by lectures on ethics gained many disciples, but later he resigned civil employ, and devoted himself to those works on philosophy which up to the present day regulate both the government and the religion of the State. He collected also the earliest documents relating to the history of his people and country, the popular songs and sacred hymns, the chronological emblems, and their explanations. (*Bunsen's God in History, Vol I, p 259*) Confucius must have been almost contemporary with Pythagoras, Thales, Socrates, Solon, Buddha and Herodotus, but the principles inculcated by the Chinese philosopher, far outvie those promulgated by the sages of ancient Greece. (*Smith's China and the Chinese, Vol II, p 145*) It is now impossible to ascertain what part of his writings was original and what obtained from previous writers, but it is generally known that he largely annotated the ancient work Yih-king, and he bequeathed five classics and four books. His works Shoo-king and Shi-king, contain the historical records of the country and the poems then extant. His book of rites regulates the manners and customs and outward forms of the whole society, and constitutes a part of his religion. Confucius is described by one of his disciples as wise, affable, condescending, just. Another as gentle, but inspiring respect, grave, but not austere, venerable yet pleasing. In the troubles that occurred from the efforts at aggrandisement which the several kings made, he was sometimes in high employ, but once at least a fugitive, but at the close of his long life, he left about three thousand

followers of his doctrines. The smaller kingdoms were annexed by the race of Tsin, of which dynasty, the first emperor was Chy-Hoang, who built the great wall. The Chinese have no existing records older than from the time of the race of Chou, in whose reign Confucius lived, and from his time authentic history commences. In the first of his four books Confucius traces a system of government from that of a family to that of a province, and from a province to a kingdom, making the family the foundation of the government. Indeed the Chinese religion has never advanced beyond a love of parents, obeying and reverencing them while alive and worshipping them when dead. It is rather a system of morality, moral philosophy, than a religion, and inculcates, rather the duties of men to one another, than to a supreme being. Their books teach that the true principles of virtue and social order are obedience to parents, elders, and rulers, and acting towards others as they would be done by. They regulate the duties alike of the sovereign and of private families. The Confucian school does not deny the existence of a Supreme Being, but neither defines this fundamental article of every rational creed, nor inculcates the necessity of worshipping the only God. He inculcates polytheism, by enjoining the worship of heaven and earth, the spirits of hills, rivers, winds and fire, in fact, all nature, excepting nature's omnipotent God. His doctrines, called in Chinese Ju-kea-shu, the religion of scholars, is the orthodox creed of the State. To the founder, divine honours are paid by all his followers, who are not very scrupulous in worshipping one idol more or less, and have long maintained the most absurd pantheism. His descendants are the only hereditary nobles. (*Gutzlaff's Chinese History, Vol I, page 68*) Confucius himself is never religious in his writings, he contents himself with recommending in general the observance of ancient precepts, of filial piety, and fraternal affection, and of maintaining a course of conduct "conformable to the laws of Heaven, which must always be in harmony with human actions" (*Huc's Christianity, Vol I, p 322.*) The followers of Confucius are, by some authors, called the sect of Ju-kea-shu. In reality, the religion, or rather the doctrine of the disciples of Confucius, is Positivism. They care nothing about the origin, the creation, or the end of the world, and very little about long philosophical speculations. Although the Emperor builds and endows temples belonging to the two other sects, the Confucian is the religion of the State, and the Court pretend to follow the scheme of ethics and politics laid down by Confucius. It is a curious com-

dence that the revival in China was contemporary with an epoch of philosophical and literary activity equally important for the West, that which commenced with Pythagoras as contemporary of Confucius, embraced Zeno, Empedocles, Herodotus, Thucydides, Socrates and Plato, and ended with Aristotle. Throughout the empire of China some vague idea is entertained by the people of the existence of one great being, whom they usually designate as Shangti, the Supreme Ruler, the Supreme Sovereign, or whom they call T'ien, Heaven, and believe that he, by a fixed destiny, controls all the affairs, and as such T'ien is taken to be an appellation of the godhead of men. The learned among the Chinese speak of him, as he is represented in their most ancient classics, as having no form, nor sound, nor savour, nor tangibility, and to their minds he appears divested of all distinct personality. The spiritual ministers of heaven they call Shin, expansive spirits, or Shin ming, illustrious spiritual beings. They divide them into the two large classes, of which one is the T'ien-shin or heavenly. But the whole number of these spirits are dependent upon, and ruled by, T'ien or the Supreme Ruler of Heaven. They rarely build any temple for the worship of Shangti, there is not one such temple in Amoy, and only one has been erected in the large city of Ching Chow. Still the people universally pay to heaven, or to heaven's lord, a sort of homage daily. Every Chinese house has a lantern suspended outside the street door, and directly over the middle of the door-way, which they call Tien kung tang, heaven's lord's lantern, or simply Tien tang, heaven's lantern. These lanterns are all lighted up, and incense is burnt for Him, during a short time every evening. Also, one day in every year they profess to devote to his honour the 9th day of their 1st month, which they call his birth day. Then they have plays acted to please him. (*Journal of the Indian Archipelago*, No VI 1848, p 350) The Chevalier Bunsen is of opinion that amongst the Chinese, their worship of the dead is the sole connecting link between them and a future state. In their disbelief of immortality, and of God, Quinet doubts if they have, in the past 5,000 years, lived a single day (*Bunsen God in Hist* p 265-7, Vol 1.) There was a long struggle for the mastery among the adherents of these three systems, a struggle which expressed itself in mutual proscriptions and persecutions. But the Confucian always succeeded in maintaining for itself the greatest ascendancy, except during some comparatively short period, and it became definitively paramount fully ten

centuries ago. From that time to this it has continued dominant in the country. It has been the philosophy and morality of all the great historians of China, and has formed the basis of her peculiar national system of legislation and administrative procedure. It may be described as the assemblage of those fundamental beliefs which are entertained by all cultivated Chinese on the phenomena of animate and inanimate nature. The literature in which it is set forth, and which it has moulded, whether notological, psychical, ethical, legislative or historical, is that, exclusively, an intimate and extensive acquaintance with which has, for many centuries, been made indispensable to the passing of the public service examinations, which are, for the talent and ambition of China, far more than the hustings, the avenues to church preferment, and the bar all combined, are for the talent and ambition of England. Hence Confucianism is, and has long been in the fullest sense of the terms, the national, orthodox, philosophy and morality of the Chinese people. Taoist and Buddhist temples exist all over China, and in latter centuries mahomedan mosques have been erected in many of its cities, but the dominant Confucianism merely endures Taoism, Buddhism, and mahomedanism as erroneous and superstitious systems of beliefs prevalent among, because most suited to, people of uncultivated or weak minds, whether rich or poor, but which find most acceptance among the poorer and therefore unlearned and unenlightened classes. They have no influence on the national polity. The people are in nowise prohibited from worshipping in the Buddhist and Taoist temples, in other words they may regulate their purely religious life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion and, in the form of philosophy or morality, extend their direct influence into the domain of the social science and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles, it is by them also that the more important acts of the private life of the Chinese are regulated, as for instance marriages. The cause of the prevalence of mahomedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature the desire to revere and the longing for immortal life. That it has, notwithstanding its want of these, holds on the human heart,

maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as thorough soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy, must be understood Confucian philosophy, and by Chinese morality, the moral principles rooted in that philosophy. And the object of these remarks being essentially practical, only brief notices will be made of the philosophical doctrines contained in Buddhism and Taoism in what is to follow, though the influence which these systems exercise as religions, will be again alluded to.

In order to get a distinct general conception of the Chinese philosophical literature, two epochs must be specially kept in mind. The first began with Confucius (Kung-tsze), who was born B. C. 551 and ended with Mencius (Meng-tsze), who died about B. C. 317. The second began with Chow-keen-ke or Chow tsze, who commenced his labours about A. D. 1034, and ended with Choo ke or Choo-tsze, who died in A. D. 1200. The first lasted for seven generations. It was separated by an interval of thirteen hundred years from the second, which lasted for five generations. Both were periods of revival of ancient learning and of further development. Both embraced several celebrated philosophers, besides those mentioned, but in each case it was the originator and closer of the epoch who became most celebrated. The writers of the second epoch are often mentioned as the philosophers of the Lung dynasty, which latter was established in A. D. 960, about 70 years before Chow-tsze's labours began, and continued in possession of the sovereignty till A. D. 1271, till about 70 years after Chow-tsze's labours closed. Confucius, though his name in the West became identified with Chinese learning, was by no means its originator. Authentic though not full records, embodying ethical and political doctrines, extended back to B. C. 2357, or to about eighteen hundred years before Confucius, while the Chinese philosophy originated with Fuh-he, who lived according to tradition, some twenty-three generations before the exact chronological era, which latter took place B. C. 2637 with the institution of the national cycle of sixty years. Allowing thirty years to a generation, this would place Fuh-he about B. C. 3327. It was he who substituted writing for the knotted strings that had previously formed the only means of record, and it was he who first established marriages, and separate families. To him are also ascribed some civilization

labours of lesser, but still great, importance, the division of the day into twelve "she-shin," or watches, of two hours each. Fuh-he is therefore the founder of Chinese civilization generally. But he is perhaps best known as the originator of the natural philosophy, and in particular as the author of the "Eight Diagrams," which were drawn by him as follows —

The multiplication of these eight diagrams by themselves produced sixty-four doubled diagrams much as —

The annotation of Confucius to the ancient work, the Yih King, states that Fuh-he got the idea of the diagrams from a figure on the back of a "dragon horse" that issued from a river. The same annotation states that, before Fuh-he invented the Eight Diagrams, he observed the configurations and appearances in the heavens and the earth, and the marks on birds and beasts, also that he derived information from his own person and from things around him. These terse passages of an ancient author are, when taken literally, apt to give a ridiculous air to the "Eight Diagrams." But a little examination shows the meaning to be that Fuh-he constructed the Eight Diagrams only after a careful and extensive survey of nature and its varied phenomena, as exhibited in the departments which we call astronomy, meteorology, physical geography, and natural history, and after reflection on his own nature, physical and mental, and on the nature of men generally as manifested in the events of the social life around him. The Eight Diagrams formed in

fact, an illustrative figure intended to elucidate Fuh-he's theory of the universe, a theory adopted after careful reflection on all animate and inanimate nature within his ken. They are in so far undoubtedly the foundation of Chinese philosophy, but it must not be assumed that learned Chinese conceive any occult power to be in them. Much in the same way we might say that the Literary Prince, having been imprisoned (while he was still a vassal of the dynasty he overthrew) by his jealous suzerain, during the years B. C. 1144, 1143, 1142, made in the seclusion a different arrangement of the Eight Diagrams, and he, with one of his sons, Chow Kung, who labored after the establishment of the family in the sovereignty, gave permanency to their joint development of the national philosophy by attaching a few words of explanation to each of the sixty-four doubled diagrams. Fuh-he's diagrams, as re-arranged, together with the short explanations of the first monarch of the Chow dynasty and his son, form the basis or text of the first of the Chinese Sacred Books, the Yih-king. After an interval of six centuries Confucius appeared, and, among his other celebrated literary labors, undertaken in B. C. 490 and the following years, edited the Yih-king, and appended those annotations, which have given the work its subsequent value. What philosophical views may have been attached to the Yih-king of Wan-wang and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius, viz, the Shoo-kings and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-he himself, have been preserved. It is these circumstances which constitute the labors of Confucius the commencement of a distinct literary epoch. Apart from the labors of Confucius himself, the permanent literary results of this, the first of the two great epochs to which attention has been directed, are contained in the collection of works called the Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius (Meng-tse) who, as already stated, died in B. C. 317, and closed the first epoch.

About B. C. 221, the prince of Tsin, one

of the vassal states into which the till then feudally governed China had been divided, made himself sovereign of the empire under the title of Che-hwang. He was a great conqueror, and was successful in opposing the inroads of the northern barbarians, the Heung-noo or Huns, one of his measures to withstand whom was the erection of the celebrated Great Wall.

In the beginning of the tenth century printing was invented, and in A. D. 932 that mode of multiplying copies of books received the imperial sanction, a printed Imperial edition of all the sacred works having been then published. "The greatest of all the arts" was not invented in Europe till five hundred years after this. Marco Polo speaks much of the "stamped" paper money of the Chinese, and he must have seen their printed books.

Chow-tsze was the originator of the second epoch of philosophical development. To him is ascribed the merit of having revived that distinct knowledge of the greatest truths which had been lost to the world for the thirteen centuries that had elapsed after the death of Mencius. And he regained that knowledge by the independent efforts of his own mind, unaided by any master. Only two of his works have been preserved, the T'ea-keh-too-shwo and the Tung-shat. He died in A. D. 1200, and in A. D. 1241, an Imperial rescript ordered his tablet, with those of four of his immediate predecessors, whose works he had annotated, to be placed in the temple of Confucius, which is to be found in every district city throughout the empire. From that time to this, a period of six hundred years, his views of philosophy, morality, and politics have been supreme in China. At this day, his commentaries on the Yih-king and the Four Books are learnt by heart by millions of Chinese, with the text of these works. The Public Service examinations cannot be passed unless this be done.

The fact is, however, that though the authors of the first and second epochs, Confucius himself included, professed to teach only what was contained in pre-existing sacred books, and though they possibly themselves believed that they did only teach what was virtually contained in such pre-existing books, they nevertheless did, in each case, originate some entirely new views and doctrines.

The Yuen dynasty which succeeded the Sung in A. D. 1271 were Mongols, immediate descendants of Chenghis Khan, who adopted Chinese civilization only in a very slight degree, and were consequently soon expelled again. The first emperor of the native dynasty, the Ming, which succeeded them in A. D. 1368, though a promoter of literature, was himself illiterate, having been a servant in a monas-

tery But the third sovereign of the line who began to reign A.D. 1103, had a splendid library formed and several encyclopedic works compiled He published an edition of the Sacred Books, which is known by the title to their title of "Tatseuen," in full completeness "

*Mahomedans* There are many thousands of mahomedans in China, who are neither zealous in the propagation of their doctrines nor over strict in the observances of their religion

*Christians* Christianity seems to have penetrated three times into China, once in the 5th or 6th century, and a French missionary who had been very much in the interior of China, states the total number of native christians at five hundred thousand M Hue's estimate is eight hundred thousand, which, as he correctly observes, is a mere nothing in the enormous population of the country These catholic christians are, however, not collected in one place, but live scattered over all China proper in small communities, called by the French *chretientes* There being, as M Hue states, scarcely any converts made at the present day, it follows that the members of these christianities are educated and trained as christians from their infancy, being either foundlings or of christian Chinese parentage They are Chinese in the outward and more obvious characteristics of dress and features, but in other respects are more like Bivarians or Neapolitans than their own countrymen, from whom they differ in many of those social and domestic customs and in all those mental peculiarities which constitute the special nationality of the Chinaman — (*T. T. Meadows' Chinese and their Rebellions*, p. 52 to 337)

The general who conquered southern China, is stated to have been a Nestorian Christian, and to have built a church at Nankin for those of his own faith Marco Polo was himself in high favour, though a Roman Catholic We learn from the Mahomedan travellers who visited China as early as A. D. 850, that it then prevailed, and that, when Canton was taken and sacked in A. D. 877, by a rebel army, as many as 120,000 Mahomedans, Jews, Christians, and Parsees perished in the sack (*Prinsep's Tibet, Tartary and Mongolia*, p. 10) Christianity did, in fact, penetrate into China as early as the 5th and 6th century, as especially in the 13th, it was very flourishing, at this epoch there existed at Pekin an archbishop with four suffragans The Chinese have also for a long time had at their command a precious collection of books of Christian doctrine, composed by the ancient missionaries, and which, even in a purely literary point of view, are much esteemed in the empire These books are diffused in great numbers throughout all the

provinces (*The Chinese Empire*, Vol. I, p. 16) A popular uprising, however, began in 1818, and still continues It originated in 1830 in the teachings of Mr Roberts, an American missionary, and of an earnest Chinese disciple It has become blended with the national struggle of the 'Taiping' or the votaries of "the divine kingdom of eternal peace," and whether Chinese scepticism will prevail is still uncertain But according to the writings of Hung, once a schoolmaster, but afterwards the "Heavenly Prince" and acknowledged head, the convert on coming to baptism must pronounce a solemn vow to take the belief in the Father, Son, and Holy Ghost, for his rule of life, and that he is resolved to dedicate this life to God, in love to the brethren, and visits to the tombs of ancestors were enjoined, in gratitude for the release of their immortal souls from this troublesome life, and to renew the vow of life-long devotion to the cause of God and the brethren The Bible is the word of God, and the Ten Commandments the moral law Opium smoking, a sin equal to adultery (*Bunsen God in Hist*, Vol. I, p. 272) The Chinese designate the Christian religion as the religion of the Lord of heaven, and M Hue observes that every one must be struck with the new doctrines with which the proclamation and manifestoes of the Pretender and his generals have been filled He styled himself 'Heavenly Prince' or celestial virtue The unity of God has been distinctly expressed, and around this fundamental dogma have been grouped a number of ideas borrowed from the Old and New Testament War has been declared at the same time to idolatry and to the Tartar dynasty (*The Chinese Empire*, Vol. I, p. 11 p. 68)

*Language* The Chinese language is usually placed amongst the Turanian group, in which are included a large mass of languages very imperfectly known, and supposed by some to have wide differences Messrs Risk and Carsten have studied this family of tongues, and the publication of their researches formed an era in philosophical research Almost every known tongue can be placed under one of three broad divisions 1. *Monosyllabic*, of which the Chinese is a striking example, a language literally without a grammar and without words, in our sense of the term, possessing 450 sounds and upwards of 10,000 ideographic signs to represent them Thus, whenever a Chinese is unable to express himself clearly, even by the aid of intonation and gesture, he must have recourse to the infallible expedient of writing. 2. *Agglutinating* the characteristic of the Tartaric and African languages, in which several words are placed

side by side, each having its own distinct meaning. 3 *Polysynthetic* characteristic of the American languages, which not only, like the Aym and other languages, combine into single words the minor modifications of each separate conception, but compress even whole sentences into one vast, almost unpronounceable word. In this group some include the Basque language, which has so long preserved its identity, although placed between two mighty kingdoms, and which in its grammatical structure resembles the aboriginal languages of America, and them alone.

The Chinese written language consists of picture words. The alphabet is a hieroglyphic system, each word having its own graphic representative. Chinese is monosyllabic, no word is allowed more than one consonant and one vowel. Hence the possible number of words is extremely small, but each word can be pronounced with various accents and intonations, of which there are said to be 450, and the number of words, or ideas in Chinese is said to be 43,496. The vastness of this amount will be appreciable by mentioning that only about 5000 words occur in the Christian Old and New Testament. M Remusat, in his *Grammaire Chinoise*, notices three styles of the Chinese written language, which he calls, style antique, style littéraire, and langue des magistrats, or langue mandarinque, but Mr Meadows considers (*Des Notes*, p 13), he is not quite correct in these definitions. Nevertheless, M Remusat is followed by M Hue, who says that the Chinese, in their written language, have three distinctions of style: the antique or sublime style, the type of which is to be found in the ancient literary monuments, and which exhibits very rare grammatical forms. The vulgar style, and the academie style, which partakes of the two preceding, being less concise than the antique, and less prolix than the vulgar. The vulgar style is employed for light productions, theatrical pieces, private letters, and proclamations intended to be read aloud. The spoken language is composed of a limited number of monosyllabic intonations, namely four hundred and fifty, which, by the very subtle variations of the accents, are multiplied to about sixteen hundred. It results from this, that all Chinese words are necessarily grouped in homophonous series, whence a great number of double meanings may arise either in reading or speaking, but their difficulty is avoided by coupling synonymous or antithetic words. In this manner the ambiguities disappear, and the conversation is no longer embarrassed. The language called Houan-hoa, that is to say, common universal language, is that which the Europeans wrong-

fully designate by the name of Mandarin language, as if it were exclusively reserved for the Mandarins or functionaries of government. The Houan-hoa is the language spoken by all instructed persons throughout the eighteen provinces of the empire, and in this, a distinction is made between the language of the north and that of the south. The first is that of Peking, it is marked by a more frequent and sensible use of the guttural or aspirate accent. It is spoken in all the provincial government offices (*Hue, Chinese Empire, Vol I, p 319*).

Shu King, or Book of Records, is a work supposed to have been edited by Confucius. It contains the Annals of China nearly to the time of Confucius.

Shu King, the sacred books of the Chinese, were translated into Latin by Father Lachartre, a Jesuit Missionary of China.

Jin Kin, or classes of men, is a Chinese book of great authority. In it the "Sages" occupy the first chapter, and in this Confucius is placed high above all others.

Li, is a Chinese word of very extensive meaning, sometimes rendered, reason, courtesy, propriety, good breeding. The saying is Li and Wen (learning) make up the whole sum of human excellencies (*Bowring*).

*Currency* The only coined money in China, are the brass pieces with a hole in the centre. Silver is sold by the weight, and an ounce is the equivalent of from 1700 to 1800 of these brass coins, which are called "sapak" by Europeans (*Prinsep's Tibet, Tartary and Mongolia, p 50*), they have some pieces of brass called *tsian*, and in Mongol *tchos*, of which the inhabitants of Siberia make *Tchok* and *Tehek*, they are of less value than a coppee. A kind of notes are in circulation among private persons.

It cannot be doubted that the Chinese have communicated their weights to all the adjacent countries. A pekul is equal to 133½ lbs avoirdupois, and four 4 lbs being equal to 3 catties, 100 catty make a pikul.

10 Cash	= 1 can	16 Tail	= 1 cat
10 Candarin	= 1 mace	100 Catty	= 1 pik
10 Mace	= 1 tal		

*Calendar* The Han dynasty of China reformed the calendar. The Chinese, like all the natives of the north-east of Asia, reckon their time by cycles of 60 years, and give a different name to each year of the cycle. The Chinese cycle of sixty years is called Hwa-kea-tsze. The year commences from the conjunction of the sun and moon, or from the nearest new moon, to the fifteenth degree of Aquarius. It has twelve lunar months, some of twenty-nine, some of thirty days. To adjust the lunations with the course of the sun, they insert,

when necessary, an intercalary month Day and night are divided into twelve periods, each of two hours (*Gutzlaff's Chinese History, Vol I, p. 73*) The Chinese division of the day is therefore as simple as the English and not much unlike it The Chinese begin the day an hour before midnight, and divide the twenty four hours into twelve parts of two hours each Instead of numbering their hours they give a different name to each period of two hours, the names and corresponding time, according to the English mode, are as follows

Tsze	11 to 1 Morning	Woo	11 to 1 Afternoon
Chow	1 to 3 "	We	1 to 3 "
Yiu	3 to 5 "	Shin	3 to 5 "
Maou	5 to 7 "	Yew	5 to 7 "
Shin	7 to 9 "	Seo	7 to 9 "
Sze	9 to 11 "	Hae	9 to 11 "

The word Keaou is added when the hour of each period is intended, and Ching for the last Thus, Keaou tsze is 11 at night, and Ching tsze 12 at night, Keaou chow 1 in the morning, Ching chaw, 2 &c &c The word K'hih "quarter," is used after the hour with the numerals yih 1, uih 2, or sau 3, to subdivide the hours into quarters, which is the smallest division commonly employed example, ching maou yih k'hih, a quarter past 6, keaou woo uih k'hih, half past 11

This division still maintains itself in legal and official language, though the practical value of the European clocks, and watches, now largely used in China, is gradually substituting for it the occidental division of twice twelve hours (*T T Meadows' Chinese and their Rebellions, p 326-330*)

**Industry and Art** The Chinese are a laborious, and diligent hearty working, pains taking race, skilful in economising materials and possessed of no mean share of inventive power Their knowledge of the magnet is supposed to have led them to a knowledge of the compass Their ordinary ink composed of lamp black and glue is sufficiently pure to be used in the arts Their ordinary cotton cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe In all working in metals, in ordinary blacksmith work, metal smelting alloys, particularly then white metal of copper, zinc, iron, silver and nickel, their sonorous gongs and bells, that of Peking being 14½ feet to 13 feet, and their ingenious metallic mirrors, some with engravings, their manufactures of porcelain, glass and glazes, their carving and engraving gems, of agates, and rock crystals and on ivory and wood have, for centuries been famed, and much of it excites the admiration of Europe, as also does their lacquer and varnish

work In weaving they are superior, in candle-making not inferior, but in painting and sculpture they do not excel They are bold, self reliant skilful gardeners, and excellent farmers, and date their skill in these back four thousand years

Fo Li is the first named sovereign of the Chinese, but the date of his reign is not ascertained Yu, the Great, is the first monarch of whose reality there is no doubt, and his accession occurred about 2000 years before the christian era Husbandry and silk weaving were the earliest of the arts cultivated by this people, the former was introduced by Shin-nong, the immediate successor of Fo-li, and silk weaving by an empress, and to both of these inventors the Chinese perform annual sacrifices on their festival days Husbandry is still highly honored, and, annually, at a grand festival in honour of the spring, the emperor ploughs and sows a field The Egyptians, Persians, and Greeks held games and festivals mingled with religious ceremonies at seed sowing, and in England, formerly, the festival of Plough Monday was held, during which the plough light was set up before the image of the patron saint of the village The Chinese, in the reign of Hoang Ti, invented the magnetic needle, the smelting of copper for making money, and vases of high art, and money seems to have been coined in gold and silver and lead, so early as Confucius' time, but many payments are still made in kind or by pieces of silver Most of their calculations are made by a reckoning board Sir John Davies is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass, which he says are justly considered in Europe as three of the most important inventions or discoveries of modern times, had their first origin in China Their printing is by a system of stereotype, the types being made from the pear-tree wood, called by them *ly-mo* Their paper is made from refuse paper, rags of silk and cotton, rice-straw, the liber of a species of morus, but principally of bamboo

The Chinese affirm that eighteen centuries ago they had discovered the secret and means of manufacturing paper Before that invention they used to inscribe written characters on strips of bamboo or sheets of metal, using a style, or pen of iron for the purpose of marking the characters, and this they assert, had been the practice of their nation from the most remote ages Before the art of paper-making had arrived at perfection, the Chinese adopted the practice of writing upon white silk, or cotton, with a bamboo pen, this was found a more convenient method than writing either on strips of bamboo or sheets

of metal, as the silk or linen could be folded into a small compass. Paper is manufactured from various materials, each province or district having its own peculiar manufacture. In Fo-kien province, it is made from young soft bamboo, in the province of Che keang, it is made from paddy straw, in the province of Kiang-Nan, it is made from the refuse silk, and this paper is very fine and delicate, being highly valued for writing complimentary inscriptions upon. To size the paper and render it fit for ink, they make a glue, somewhat similar to isinglass, from fish bones, these they chop up very small, and soak the mass in water which is continually renewed. When all oily impurity is extracted, they add a due proportion of alum, which has been dissolved. Over the vessel in which this mixture is, a rod is laid, a cleft stick is used for holding the sheet of paper during the process of dipping, as soon as the paper has been sufficiently saturated it is withdrawn, by gently rolling it round the stick which has been laid over the vessel, the sheet of paper is afterwards hung to dry either near a furnace, or in the sun. Paper with written or printed characters is reverently preserved in all eastern countries. In China, fragments of waste paper are carefully picked up from the streets lest any of the words of sainted men should be dealt with profanely. Writing seems to have been known from the earliest times, and literature has always held a high place — *Sun's China and the Chinese, Vol II, p 4*

They are skilful carvers. Ivory comes to China principally from Cochin-China and Africa, via Bombay, and always finds a ready sale at Canton, the largest and best tusks weigh from 16 to 25 pounds each, decreasing to five or six pounds. The cuttings and fragments also form an article of trade, as the workmen can employ the smallest pieces. Bones and horns, especially the long horns of buffaloes, are in China worked into handles, buttons, &c. Rhinoceros' horns are brought from Burmah, from Sumatra, and from Africa through Bombay, they are highly valued by the Chinese from a notion that cups made from them sweat whenever a poisonous mixture is poured into them. A perfect horn sometimes sells as high as \$300, but those that come from Africa do not usually rate above \$30 or \$40 each. The principal use of these horns is in medicine and for amulets, for only one good cup can be carved from the end of each horn, and consequently the parings and fragments are all preserved. The hard teeth of the walrus, lamantin, and other cetaceous animals, also form an article of import into China from the Pacific, under the designation of sea-horse teeth, they weigh one

or two pounds a piece, and the ivory is nearly as compact, though not so white, as that of the elephant. The delicate carving of Chinese workmen is well known, and has often been described, many specimens of it are annually sent abroad. Few products of their skill are more remarkable than the balls, containing ten or twelve spheres cut out one within another. The manner of cutting these is simple. A piece of ivory or wood is first made perfectly globular, and then several conical holes are bored into it in such a manner that their apices all meet at the centre, which is usually hollowed out an inch or less after the holes are bored. A long crooked tool is then inserted into one of the conical holes, so bent at the end and stoppered on the shaft that it cuts the ivory at the same distance from the surface when its edge is applied to the insides of the cone. By successively cutting a little on the insides of each conical hole, their measures meet, and a spherical is at last detached, which is now turned over and its faces one after another brought opposite the largest hole and firmly secured by wedges in the other holes, while its surfaces are smoothed and carved. When the central sphere is done, a similar knife, somewhat larger, is again introduced into the holes, and another sphere detached and smoothed in the same way, and then another, until the whole are completed, each being polished and carved before the next outer one is commenced. It has been supposed by some that these curious toys were made of hemispheres nicely luted together, and they have been boiled in oil for hours in order to separate them and solve the mystery of their construction. Fans and card-cases are carved of wood, ivory, and mother-of-pearl in alto relievo, with an elaborateness which shows the great skill and patience of the workman, and at the same time his bad style in drawing, the figures, houses, trees, and other objects being grouped in violation of all propriety and perspective. Beautiful ornaments are made by carving roots of plants, branches, gnarled knots, &c, into fantastic groups of birds or animals, the artist taking advantage of the natural form of his materials. Models of pagodas, boats, and houses are also entirely constructed of ivory, even to representing the ornamental roofs, the men working at the oar, and women looking from the balconies. Baskets of elegant shape are woven from ivory splinters, and the shopmen at Canton exhibit a variety of seals, paper-knives, chessmen, counters, combs, &c, exceeding in finish and delicacy the same kind of work found anywhere else in the world. The most elaborate coat of arms, or complicated cypher, will also be imitated by these skilful

carvers The national taste prefers this style of carving on plane surfaces, it is seen on the walls of houses and granite slabs of fences, the wood-work of boats and shops, and on articles of furniture Some of it is pretty, but the disproportion and cramped position of the figures detract from its beauty The ivory carving, ebony and other hard wood ornaments, the bronzes and porcelain specimens, are all exquisitely worked, in England varying from 4*l* and 5*l* — (*William's Madagaskar Kingdom, Vol II, pages 141 and 408 Yule's Embassy, p 59 Hodgson's Nagasaki* )

In the arts, and in the economic application of materials, the Chinese are very skilful The candles used in Japan are made of an oil said to be pressed out of the seeds of the *Rhus succedanea* ? This oil becomes, when concrete, of the consistence of tallow, and is not so hard as wax The province of Fetsigo, more particularly, produces this tree, and consequently supplies the greatest quantity of this oil In the eastern parts of China, the product of the tallow tree, *Stillingia sebifera*, and beef and hog's tallow in the south, are used in the manufacture of candles Wax is only employed to incase the tallow or laid, which, from the heat of the climate and its unclarified condition, never becomes hard

**Lacquer** The beautiful lacquer-ware, which is so universally admired, is made principally near Nankin, being considered far superior to that which is made in Kwan tung and the other provinces The following is the mode of preparing the ware, which is frequently used for articles of furniture, and the process of the manufacture of a table, which has a landscape with figures delineated on the top in gold, may be thus described The timber being first put together, and rendered perfectly smooth, is covered with transparent paper, besmeared with pork fat As soon as this paper is quite dry, it is covered with a paste made from a peculiar description of clay When this substance has become completely dry and hard, it is rubbed down with a whetstone, to remove all inequalities of surface, as soon as this process is complete, the lacquer is laid on, then allowed to dry and harden, when the process is again repeated three or four times more, the lacquer being allowed to become completely dry and hard between each several coating The intended landscape is traced on the top of the table by throwing a fine white powder, over paper, on which the landscape has been traced, by means of small perforations, thus forming the outline of the picture a minute instrument, somewhat resembling a style, is drawn carefully over the perforations, by this means tracing the landscape on

the surface of the table The picture is then besmeared with a compound of size and red paint, the gold, first reduced to a powder, is then applied, the raised appearance of the figures being produced by means of a preparation of gum combined with other ingredients the picture is allowed to become perfectly dry, when, if requisite, another coat of the lacquer or varnish is then added To prepare this lacquer-ware in perfection, requires a lengthened period, and a Chinese manufacturer mentioned that to produce a fine specimen, elaborately painted, six months ought to elapse between the commencement and the termination of the work, thus affording time for each coat of lacquer to become thoroughly hardened before another is applied The designs traced upon their porcelain in China are very inferior, but the colours used by the artists who paint these designs are far superior to any European colouring

**Colours.** The Chinese red colour is made from Taow-fan, or copperas, their mode of preparation is by putting a pound of copperas into a crucible, over which another crucible is luted, having a small hole in it, which is lightly covered over around these they pile charcoal, and enclose the whole within bricks, when they fire the charcoal, and as soon as the fumes, issuing from the aperture in the crucible, become of a light colour, a small quantity of the copperas is taken therefrom, laid upon fir-wood, and moistened with water if the colour then prove to be a bright red, they remove the fire, if not, they allow the copperas to remain subjected to the heat until it assumes that colour, and then remove the fire When the crucibles are cool, a cake is found in the lower one, but the finest colour is encrusted on its sides, and on the bottom of the upper crucible, which is kept separate from the cake, the pound of copperas produces about four ounces of colour The white colour is made from calcined transparent flint, to an ounce of the powder of which they add an equal quantity of white lead Their beautiful green is prepared with one part of powdered calcined flint, two parts of white lead, and six parts of the scales of well hammered copper

The violet is produced by adding an additional quantity of the prepared white to the green, yellow is made by combining equal portions of prepared white and red All these various colours are used by the China-ware painters, having been previously dissolved in gum-water, to which they occasionally add saltpetre, copperas, or white lead The colours are laid on after the first baking and varnishing of the China-ware, but the beauty

and depth of the colouring is imperceptible until after the second taking

*China-ware* The Ow-mi-ew, or black China ware, ornamented with gold, is very much prized in China, to make which they mix three ounces of azure, and seven of the oil of stones, this is laid on the ware, and when perfectly dry, it is baked, after which the gold is laid on, and the vessel is rebaked. The Towi-kie is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined transparent white pebbles, this has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited, this China-ware is highly prized under the cognomen of the cracked porcelain

Among the manifold and various manufactures of China, the gold and silver tinsel cloths of Pekin stand deservedly in high estimation, their chief value arises from the peculiar property which they possess of never tarnishing or becoming discolored

The gold and silver filagree work of the Chinese equals any ever produced by ancient Venetian masters, and their chasing in silver is unrivalled. The art of enamelling on silver is also brought to great perfection in China, and specimens surpass any ever produced at Genoa—(*Sir's China and the Chinese, Vol I, p 387 II, p 1 to 4*)

*Food* The great staff of life in China is rice, which is either eaten dry, or mixed with water, so as to resemble a soup. Out of rice they make their chief intoxicating liquor, which when good is something like strong whisky, both in its colourless appearance and its smoky flavour. Several vegetables are consumed, such as the sweet potato, Barbadoes millet, peas, beans, turnips, carrots, &c. Of their fruits, the orange, lichee, loquat and mangoes are much in use. Their favourite animal food is pork, the taste for which is national. There is a maxim prevalent among them, that "a scholar does not quit his books nor a poor man his pigs." The flesh of the bullock, sheep, deer, dog, cat, wild cat, rat, and horse is eaten, but compared with that of swine, it is a rarity. Fish are eaten in great abundance, either fresh, dried, or salted, and they rear great quantities of ducks and various species of fowl for the table. The comprehensive principle on which Chinese diet is regulated, is to eat everything which can possibly give nourishment. The luxuries consumed by the rich consist of the edible bird's nest, the beche de mer or sea slug, shark fins, fish maws, cow sinews, points of stag antlers, buffalo hides, which afford the

gelatinous food considered so restorative. Amongst their delicacies also are dishes made of the larvæ of the sphinx moth, and of a grub bred in the sugar cane. In China, the various modes of catching and rearing fish exhibit the contrivance and skill of the Chinese quite as much as their agricultural operations. According to the Repository, at least one-tenth of the population derive their food from the water, and necessity leads them to invent and try many ingenious ways of securing the finny tribes. Nets are woven of hempen thread, and boiled in a solution of gambier (*Uncaria gambier*) to preserve them from rotting. The smacks which swarm along the coast go out in pairs, partly that the crews may afford mutual relief and protection, but chiefly to join in dragging the net fastened to their boats. In the shallows of rivers, rows of heavy poles are driven down, and nets secured to them, which are examined and changed at every tide. Those who attend these nets, moreover, attach scoops or diag-nets to their boats, so loaded that they will sink and gather the sole, ray, and other fish feeding near the bottom. Lifting nets, 20 feet square, are suspended from poles elevated and depressed by a hawser worked by a windlass on shore, the nets are baited with the whites of eggs spread on the meshes. Cormorants are trained in great numbers in the eastern provinces to capture fish, and are sometimes under such good order that they will disperse at a given signal, and return with their prey without the precaution of a neck ring. A single boatman can easily oversee twelve or fifteen of these birds, and although hundreds may be out upon the water, each one knows its own master. If one seize a fish too heavy for it alone, another comes to his assistance, and the two carry it aboard. The birds themselves are fed on bean-curd, and eels or fish. They lay eggs when three years old, which are often hatched under barn-yard hens, and the chickens fed with eel's blood and hush. They do not fish during the summer months. The price of a pair varies from \$5 to \$8. Mussels are caught in small cylindrical basket traps, attached to a single rope, and floated with the tide near the bottom. The rearing of fish is an important pursuit, and the spawn is sometimes deposited in proper vessels, and placed in favorable positions for hatching. The Bulletin Universel for 1839 asserts that in some parts of China, the spawn so taken is carefully placed in an empty egg-shell, and the whole closed. The egg is then replaced in the nest, after the hen has sat a few days upon it, reopened, and the spawn placed in vessels of water warmed by the sun, where it soon

hatches. Shell-fish and mollusks, both fresh and salt, are abundant in the Chinese market, but they have not been examined scientifically. Oysters of a good quality are common along the coast, and a species of *Macra*, or sand clam is fished up near Macao. The pearl river affords two or three kinds of freshwater shell fish, of the genus *Mytilus*, which are obtained by dredging. The prawns, shrimps, crab, crawfish, and other kinds of crustacea met with are not less abundant than palatable, one species of crawfish, as large but not taking the place of the lobster called lang hai, or dragon crab, cuttle-fish of three or four kinds, and the large king crab (*Polypheumus*), are all eaten by the Chinese though not relished by others. The true cod has not been observed on the Chinese coast, but several species of *Serranus* (as *Plectropoma susuki*, *Serranus shihpan*, *megachir*, &c.) generally called shippan by the natives, and garoupa by foreigners, are common about Macao, and considered the most delicate flavoured of any in the markets. Another common and delicious fish is the *Polynemus tetradactylus* or bynni-carp, usually called salmon by foreigners. Isinglass is prepared from its skin. The pomfret, or stanguu of the Chinese (*Stromateus argenteus*), is a good pan fish, but not so delicate as the sole-fish, many species of which abound in the shallows of the Bogue. Two or three species of mackerel, the *Sciæna lucida*, an *opluocephalus*, the mullet, the white rice fish and a kind of shad complete the list of good table fish found in the markets of Canton. — (*Williams' Middle Kingdom*, Vol II, p 110, 169, 270 & 272.) Immense quantities of fish, are likewise, daily caught in the Chinese rivers. Their mode of catching them is ingenious and amusing. One day Mr Fortune was going up a considerable distance in a boat, and set out a little before low-water, that he might have the full benefit of the flow of the tide, and get as far up as possible before it turned. On the side of the river, a few miles above Ningpo, he observed some hundreds of small boats anchored each containing two or three men, and the tide turning just as he passed, the whole fleet was instantly in motion, rowing and sculling up the river with great rapidity. As soon as the men reached a favourable part of the stream, they cast out their nets and began to make a loud noise, splashing with their oars and sculls with the intention of driving the fish into the nets. After remaining at work in this spot for about a quarter of an hour, all the boats set off again, farther up, for the next station, when the crew commenced again in the same noisy manner, and so on for a long way up the river, as long as

the tide was flowing, they then returned with the ebb, loaded with fishes for the next morning's market. But the most singular of all the methods of catching fish in China is that of training and employing a large species of cormorant for this purpose, generally called the fishing cormorant. These are certainly wonderful birds. I have, he says, frequently met with them on the canals and lakes in the interior, and, had I not seen with my own eyes their extraordinary docility, I should have had great difficulty in bringing my mind to believe what authors have said about them. The first time I saw them was on a canal a few miles from Ningpo. I saw them on my way to a celebrated temple in that quarter, where I intended to remain for some time, in order to make collections of objects of natural history in the neighbourhood. When the birds came in sight, I immediately made my boatmen take in our sail, and we remained stationary for some time to observe their proceedings. There were two small boats, containing one man and about ten or twelve birds in each. The birds were standing perched on the sides of the little boat, and apparently had just arrived at the fishing ground, and were about to commence operations. They were now ordered out of the boats by their masters, and so well trained were they, that they went on the water immediately, scattered themselves over the canal, and began to look for fish. They have a beautiful sea green eye, and, quick as lightning, they see and dive upon the funny tribe, which, once caught in the sharp notched bill of the bird, never by any possibility can escape. The cormorant now rises to the surface with the fish in its bill, and the moment he is seen by the Chinaman he is called back to the boat. As docile as a dog, he swims after his master, and allows himself to be pulled into the San-pan, where he disgorges his prey, and again resumes his labours. And, what is more wonderful still, if one of the cormorants get hold of a fish of large size, so large that he would have some difficulty in taking it to the boat, some of the others, seeing his dilemma, hasten to his assistance, and with their efforts united capture the animal and haul it off to the boat. Sometimes a bird seemed to get lazy or playful, and swam about without attending to his business, and then the Chinaman with a long bamboo, which he also used for propelling the boat, struck the water near where the bird was, without, however, hurting him, calling out to him at the same time in an angry tone. Immediately, like the truant schoolboy who neglects his lessons and is found out the cormorant gives up his play and resumes his

libours A small string is put round the neck of the bird, to prevent him from swallowing the fish which he catches, and great care is taken that this string is placed and fastened so that it will not slip farther down upon his neck and choke him, which otherwise it would be very apt to do. Since I first saw these birds on the Ningpo canal, I have had opportunities of inspecting them and their operation in many other parts of China, more particularly in the country between the towns of Hangchow-foo and Shanghai. I also saw great numbers of them on the river Min, near Foochow-foo. They sell at a high price even amongst the Chinese themselves—I believe from six to eight dollars per pair, that is, from 30s to 40s. The fish-catching birds eat small fish, yellow eels and pulse jelly. At 5 P.M. every day each bird will eat six taels (eight ounces) of eels or fish, and a catty of pulse jelly. They lay eggs after three years, and in the fourth or fifth month. Hens are used to incubate the eggs. When about to lay, their faces turn red, and then a good hen must be set upon the eggs. The date must be clearly written upon the shells of the eggs laid, and they will hatch in twenty-five days. When hatched, take the young and put them upon cotton spread upon some warm water, and feed them with eel's blood for five days. After five days they can be fed with eel's flesh chopped fine, and great care must be taken in watching them. When fishing, a straw tie must be put upon their necks, to prevent them from swallowing the fish, when they catch them. In the eighth or ninth month of the year they will daily descend into the water at ten o'clock in the morning, and catch fish until five in the afternoon, when they will come on shore. They will continue to go on in this way until the third month, after which time they cannot fish until the eighth month comes round again. The male is easily known from the female, in being generally a larger bird, and in having a darker, and more glossy feather, but more particularly in the size of the head, the head of the male being large and that of the female small. Such are the habits of this extraordinary bird. As the months named in the note just quoted refer to the Chinese calendar, it follows that these birds do not fish in the summer months, but commence in autumn, about October, and end about May—periods agreeing nearly with the eighth and third month of the Chinese year.—(*Fortune's Wanderings*, pages 104 to 113)

Chinese fishermen, when they take one of those huge *Rhizostoma* which abound on the coast, rub the animal with pulverized alum to give a degree of coherence to the gelatinous mass

Mr Crawford, after stating that the fisheries of the Indian islands form the most valuable branch of their commerce, and that a great variety of the fish caught are dried in the sun, proceeds to observe that ordinary dried fish form no portion of the foreign exports of the Indian Islands, but three singular modifications of it do, fish-maws, shark-fins, and tripang, all of which are sent to China in large quantity from the northern coast of Australia. The people of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages thither in quest of tripang. Gutted, dried in the sun and smoked, it is considered cured, and fit for its only market that of China, to which many hundred tons are yearly sent for the consumption of the curious epicures of that country. The fishery of the tripang is to China what that of the sardine, tunny, and anchovy is to Europe. There are no seas in the world more abounding in esculent fish than those of the Asiatic Archipelago, and some of them are of excellent flavour. Fish constitutes the chief animal aliment of all the inhabitants, and everywhere of those of the sea-coast who are by profession fishermen. Among the best fisheries are those of the eastern coast of the Malay Peninsula, those of the entire Straits of Malacca, of the northern coast of Java, and of all the coasts of Borneo and Celebes, with those of the Philippine Islands. The taking of the mother-of-pearl oyster, the pearl-oyster in a few places, of the holothurion or tripang, and of the shell tortoise, form valuable branches of the Malayan fisheries.—(*Crawford's Dictionary*, page 138)

*Domestic and social relations of the Chinese* Polygamy exists, and any man may have his second, third or inferior wives. Women, even as first wives, do not take a favourable position in their households, though as mothers their condition is vastly improved. Mr T. T. Meadows (*Chinese and their Rebelions*, pp 538 9) writes strongly on the injurious effects on women which the right to have many wives occasions. The Chinese differs seemingly from mahomedan polygamy in this, that a mahomedan woman can legally hold property, is the owner of her own dower, and each wife has a separate establishment and a separate allowance for herself. In China the extent to which wives are, by law and custom, in the power of their husbands, would produce deplorable effects, but for the almost unlimited power which law and opinion give mothers over their sons of every rank and age. So also the institution of polygamy is largely counterbalanced by the desire of all the men to marry early, in order to secure a progeny of sons as soon as possible. The condition of

the Chinese woman is most pitiable suffering, privation, contempt, all kinds of misery and degradation seize on her in the cradle, and accompany her pitilessly to the tomb. Her very birth is commonly regarded as a humiliation and a disgrace to the family, an evident sign of the malediction of Heaven. If she be not immediately suffocated, she is regarded and treated as a creature radically despicable, and scarcely belonging to the human race. Pan-hou pin, celebrated among Chinese writers, though a woman, endeavours, in her works, to humiliate her own sex, by reminding them continually of the inferior rank they occupy in the creation. "When a son is born," she says, "he sleeps upon a bed, he is clothed with robes, and plays with pearls, every one obeys his princely cries. But when a girl is born, she sleeps upon the ground, is merely wrapped up in a cloth, plays with a tile, and is incapable of acting either virtuously or viciously. She has nothing to think of but preparing food, making wine, and not vexing her parents." In ancient times, instead of rejoicing when a child was born, if it happened to be a girl, they left it for three whole days on a heap of rags on the ground, and the family did not manifest the slightest interest in so insignificant an event. This public and private servitude of women, a servitude that opinion, legislation, manners, have sealed with their triple seal, has become, in some measure, the corner stone of Chinese society. The young girl lives shut up in the house where she was born, occupied exclusively with the cares of housekeeping, treated by every body, and especially by her brothers, as a menial, from whom they have a right to demand the lowest and most painful services. The amusements and pleasures of her age are quite unknown to her, her whole education consists in knowing how to use her needle, she neither learns to read nor to write, there exists for her neither school nor house of education, she is condemned to vegetate in the most complete and absolute ignorance, and no one ever thinks of, or troubles himself about, her, till the time arrives when she is to be married. Nay, the idea of her nullity is carried so far, that even in this, the most important and decisive event in the life of a woman, she passes for nothing, the consulting her in any way, or informing her of so much as of the name of her husband would be considered as most superfluous and absurd. In China a woman counts for nothing. The law ignores her existence, or notices her merely to load her with fetters, to complete her servitude, and confirm her legal incapacity. Her husband, or rather her lord and master, can strike her with impunity,

starve her, sell her, or, what is worse, let her out for a longer or shorter period, as is a common practice in the province of Tche-kiang. Polygamy aggravates the sufferings of the Chinese wife. When she is no longer young, when she has no children, or none of the male sex, her husband takes a second wife, of whom she becomes in some measure the servant. The household is then the seat of continual war, full of jealousies, animosities, quarrels and not unfrequently of battles. When they are alone they have at least the liberty of weeping in secret over the cureless sorrows of their destiny. The little Chinese girl born in a christian family is not murdered, as is often the case among the pagans. Religion is there to watch over her at her birth, to take her lovingly in its arms, and say, here is a child created in the image of God, and predestined, like you, to immortality — (*Huc Chinese Empire, Vol I, pp 248 to 252*)

The bride is seldom seen by the husband until she leave the sedan chair in which she is conveyed with her belongings, to his house. Mandarin ducks are introduced at marriages as patterns of conjugal felicity. In the little feet of the Chinese women, the four smaller toes appear grown into the foot, the great toe being left in its natural position. The fore part of the foot is so tightly bound with strong broad ligatures, that all the growth is forced into height instead of length and breadth, and forms a thick lump at the ankle, the under part measures scarcely four inches long and an inch and a half wide. The foot is constantly bound up in white linen or silk, and strong broad ribbons, and stuck in a very high-heeled shoe. The crippled fair ones trip about with tolerable quickness, to be sure they waddle like geese, but they manage to get up and down stairs without the help of a stick. (*Sinnet's Lady's Voyage, p 50*) Infanticide, of which the husbands are the only perpetrators, is not uncommon, but female children only are murdered, and those immediately after their birth. This horrible crime meets with no punishment from the laws of the country, a father being the sovereign lord of his children, he may extinguish life whenever he perceives, or pretends that a prolongation of it would only aggravate the sufferings of his offspring.

The Chinese are not a moral, though they are a ceremonial people. Their usual salutation, when meeting, is Haou tsing-tsing. Are you well? Hail! Hail! They, like most of the natives of the East, waste much time before commencing the business for which they meet. M. Huc tells us that the conversation must always begin on indifferent and mostly insignificant subjects, and this is, perhaps, the

most difficult part of the ceremonial. In China, you generally have to pass about two hours in saying nothing, and then, at the end of the visit, you explain in three words what really brings you there. The visitor rises and says, "I have been troublesome to you a very long time," and, doubtless, of all Chinese compliments, this is the one that most frequently approaches the truth. They are not truthful. Sir John Bowring says of them that his experience in China, and many other parts of the East, predisposes him to receive with doubt and distrust any statement of a nature when any, the smallest, interest would be possibly promoted by falsehood (*Bowring's Siam*, Vol I, p 105). They are largely given to the use of opium. Mr Knowlton estimates that there are 2,351,115 confirmed opium smokers, or one in every 170 of the population.

*Burial customs.* In China, the tombs of the opulent are decorated with statues of men and horses. They run into excess in mourning for the death of near relations. Every part of the ceremonial is exactly regulated, even the period, manner, and degree of the mourner's grief being duly prescribed. The corpse being dressed in warm clothes, is deposited in a substantial coffin, and kept for several days above ground whilst the survivors express their measured grief by gesture, dishevelled hair, sackcloth, and mournful silence. When a lucky spot has been selected for the grave, the corpse is consigned to the bosom of our universal mother, earth. Building a tomb in the form of a horse-shoe, they inscribe thereon the name of the deceased, erect a tablet to his memory in the hall of his ancestors, and repair annually to the grave, in order to prostrate themselves before the manes, and to offer victuals in sacrifice to the spirits. In the temples, divine honours are paid to their memory. To supply their full wants, in the other world, they burn gilt paper, paper chariots and houses, with every necessary article of furniture, which are supposed to be changed in the other world into real utensils, whilst the gilt paper, when burnt to ashes, becomes so much ready money. The greater the personage, the more protracted is the mourning, the emperor mourns three years for his parent, and every good subject follows his august example. Mandarins resign their office during this period of affliction, literati avoid entering the examinations, the common people abstain for some time from their labour. Chinese "suttee" prevailed to a considerable extent until about a century ago. It does not appear, however, to have been regarded as a compulsory rite, but was generally the widow's own choice to show her

extreme fidelity, or to escape the hardships of widowhood, or in the case of dutiful sons, to save the life of a parent. Fire was never used, but opium, poison or starvation was the means of suicide employed. Yüan Chang was the first emperor who discountenanced those practices, which his immediate predecessors had encouraged, and he forbade honorary tablets to be erected to self-immolating victims. In 1792 a memorial was presented to the emperor praying for the dedication of a tablet to a most dutiful son, who had cut out his liver in order to cure his mother's sickness. The imperial "Board of Rites," after mature deliberation, respectfully observed that the practice of cutting out the liver is that of the ignorant, showing a contempt for their lives, and after all, but foolish devotion, and a decree was issued discountenancing the custom.

The China seas are celebrated for their furious gales of wind, known among seamen as typhoons and white squalls. Within the region of the China Sea there are no five month monsoons. They do not prevail from the west of south more than two or three months. Between 15° and 20° north, 110° and 115° east there appears to be a system of three monsoons, that is, one from the north-east in October, November, December and January, one from east in March and April, changing in May, and another from the southward in June, July and August, changing in September. The great disturber of the atmospheric equilibrium appears to be situated among the plains and steppes of Asia, their influence reaches up to the clouds, and extends to the China Seas, it is about the changing of the monsoons that these awful gales, called typhoons and white squalls are most dreadful. In like manner, the Minutius hurricanes, or the cyclones of the Indian Ocean, occur during the unsettled state of the atmospheric equilibrium, which takes place at that debatable period during the contest between the trade-wind force and the monsoon force, and which debatable period occurs at the changing of the monsoon, and before either force has completely gained or lost the ascendancy. At this period of the year, the winds breaking loose from their controlling forces, seem to rage with a fury that would break up the very fountains of the deep—*Mauvys Physical Geography*, p 424. *Royle Arts, &c., of India*, page 484. *Thunberg's Travels*, Vol III, p 188. *Rhode MSS Rec.* *Frederic W. This nettle grows in all the moist countries from Bengal, through Rungpore, Assam into China, and southward all through the Malay Peninsula into Sumatra, Java, and Celebes It was fully described by Dr Roxburgh, (in 590) as *Urtica tenacissima* In Bengal and Assam its fibre has been used only for string and ropes by the fishermen and by the Dom race of Assam But in China, where it has long been woven into the China grass cloth, it is carefully cultivated, and great care is also

taken in the process of cutting down scraping, peeling, steeping and bleaching the fibre These indeed are detailed minutely in the Imperial Treatise of Chinese Agriculture, lib XXXVIII, fol 3 When grown from seed, a sandy soil is preferred, the ground is repeatedly dug, formed into beds, a foot broad and four feet long, raked and smoothed and watered, again raked and again smoothed, and a pint of seed mixed with four pints of earth is scattered on the surface of six or seven beds, and left uncovered in They are sheltered from the sun by a canopy of matting or grass, which is kept damp, and this shelter is retained till the plants be an inch or two high The young plants are then to be transferred into a stiffer soil, which is afterwards repeatedly hoed, and top dressings of fresh horse dung, ass, or cow dung can be used This process is adopted only where the roots of old plants are not obtainable The plant grows best from shoots or layers Dr Royle (Fib pl p 344) gives the following as the Indo-Chinese method for preparing the Rheeia Fibre, as adopted in Upper Assam, by Major Hannay

To cut the rheea—The Rheeia is fit for cutting when the stems become of a brown colour for about six inches upwards from the root Hold the top of the stalk in the left hand, and with the right hand strip off the leaves by passing it quickly down to the root, and cut off with a sharp knife, taking care to be above the hairy networks of the roots, as these should be covered up with manure immediately to ensure another crop quickly, lop off the tender top to the stalk, and make the reeds up into bundles of 200 or 250, if the stripping process is not to be carried on in the field or garden, but it is best to strip off the bark and fibre on the spot, as the burnt ashes of the stem afford a good dressing for the roots along with dry cow dung To strip off the Bark and Fibre—The operator holds the stalk in both hands nearly in the middle, and pressing the forefinger and thumb of both hands firmly, gives it a peculiar twist, by which the inner pith is broken through, and then passing the fingers of his right and left hand rapidly, alternately, towards each end, the bark and fibre is completely separated from the stalk in two strands

Making up into Bundles—The strands of bark and fibre are now made up into bundles of convenient size, tied at the smaller end with a shred of fibre, and put into clean water for a few hours, which he thinks deprives the plant of its tannin or colouring matter, the water becoming quite red in a short time

Cleaning Process—Is as follows The bundles are put on a hook fastened in a post, by means of the tie at the smaller end,

at a convenient height for the operator, who takes each strand separately of the larger end in his left hand, passes the thumb of his right hand quickly along the inner side by which operation the outer bark is completely separated from the fibre, and the riband of fibre is then thoroughly cleaned by two or three scrapings with a small knife. This completes the operation, with some loss, however, say one-fifth, and if quickly dried in the sun it might at once be made up for exportation, but the appearance of the fibre is much improved by exposure (immediately after cleaning) on the grass to a night's heavy dew, in September or October, or a shower of rain during the rainy season. After drying, the colour improves, and there is no risk from mildew on the voyage homewards—(Royle *Fib Pl* page 344) The French have been growing China-grass in small quantities, ever since 1844, in which year a packet of China-grass seed was sent home by M. Leclanchet, surgeon to the war corvette *La Favorite*. 'Twenty years' experience having proved that it will grow in France luxuriantly, processes for preparing and working up its fibre have been invented by MM. Mallard and Bouneau. But MM. Mallard and Bouneau do not obtain the fibre in a state in which it has that lustre which distinguishes it when prepared by Mr. Gray's process, or in which it is capable of being spun by itself,—they work it up mixed with half its weight of Surat cotton. The report of the Rouen Chamber of Commerce declares that China-grass fibre has an affinity for colouring matters at least equal, if not superior, to that of the very finest kinds of cotton. It is found that the plant will flourish north of Paris, and even in Belgium. The process here alluded to as that of Mr. Gray is said to produce China-grass fibres almost as strong as so much silk, quite as free and unentangled as the fibres of the most perfect samples of cotton wool, and evidently capable of being spun into as delicate a yarn as ever was produced from the very best Sea-island cotton. It possesses a lustre far exceeding that of cotton, greatly in excess of that of native Indian "grass cloth." Mr. Gray's process is practicable on any scale, and is applicable to a great many fibrous plants besides China grass. It has already been applied, experimentally, with the utmost success, to jute, hemp, New Zealand flax, and various other plants. The public prints show that Lord Mayo has directed much attention to this fibre which is said to bring prices of £60 to £120 a ton. But such prices could only be obtainable for well prepared fibre of the finest quality. It is said to be procurable at Ningpo at £20 the ton. Since

Dis Roxburgh and Marsden's times, Dr Willich, Sir W. Hooker, Sir G. Staunton, Mr. Ewei of Bencoolen, Dr. Taylor, Dr. F. B. Hamilton, Major Jenkins, Captain Dalton, Major Hanuay, Dr. Royle, Dr. McGowan of Ningpo, and Dr. Falconer, have paid much attention to it.—*Roxb* in 590 *Royle Fib Pl*

CHINA WARE, or porcelain, once so extensively exported from China, is now almost confined to the commonest and cheapest descriptions of stoneware, by far the greatest portion of which goes to India. The patterns made by the Chinese seldom change, while the European manufacturers both consult and lead the taste and fancy of their customers, and it is owing to this, in some degree, that the demand for the Chinese finer ware has ceased, though the Mongols, Siamese, Hindus, and islanders in the Archipelago are still chiefly supplied from China. When the productions of the East were first carried round by the Cape of Good Hope, the porcelain of China bore an enormous price, and the profits of manufacturing it having been ascertained, the European nations began to make it, and soon out-rivaled the Chinese. China-ware is sold in China in sets, consisting of a table set of 270 pieces, at from 12 to 75 taels, a breakfast set of 20 pieces, at three taels, a long tea set of 101 pieces, at 11 to 13 taels, and a short tea set of 46 pieces, at from 5 to 6 taels. Flower-pots, vases, jars, fruit baskets, table ornaments, &c., are made of porcelain to any pattern by the Chinese. It is still sent to Bombay and other parts of India, and also to the United States.—*Compendium by Hon'ble Mr. Morrison* See Ceramic manufactures

le CHINCHONA, a genus of plants, natives (in) of South America, several species of which are of great value in medicine yielding "Bark" or Peruvian or Cinchona Bark, from which quinine is produced. The known species are *C. longifolia*, *C. calisaya*, *C. condaminea*, *C. cordifolia*, *C. cuneata*, *C. lucumæfolia*, *C. magnifolia*, *C. micrantha*, *C. oblongifolia*, *C. officinalis*, *C. pahudii*.

*C. peruviana*, *C. ovata*, *C. purpurea*, *C. succiruba* and *C. scrobiculata*, ten of which have been introduced into India, and the introduction has been the most successful of all attempts previously made with exotics. Fortunately no long period is required before Cinchona trees become productive. It is not necessary that the plant should grow into a forest tree before it yields its bark. The "Quill Bark" stripped from saplings, just as cinnamon is prepared, is found to be rich in gumme. In about five years a plantation is likely to become productive. From the Ootacamund plantation, plants have been sent to Mahabaleshwar, Dharmasala and other parts of the Himalaya.

CHINESE TARTARY, also known as Little Bokhara, also as Eastern Turkistan, is a great depressed valley shut in by mountains of great height on three sides, and on the east are barren sands which merge imperceptibly into the Great Desert of Gobi. The Tian-Shan range separates it from Dzungaria, the Bolor range from Transoxiana, and the Kara Koram and Kuen Lun from India and Tibet on the south. The land is clayey near the base of the mountains, but sandy in the central tracts. Rain is rare and the air is of exceeding dryness, but the climate is temperate and healthy. It is well watered from the mountains, the waters converging towards the Ergol or Taiym. The country has gold, copper, salt, sulphur and the jade-stone. The southern line of the caravan route passes through it from Khami to Aksu and Kash-

gar From Aksu to Kokand is 800 miles. It was subject to China from the beginning of the Christian era, to the time of Changiz Khan. After the middle of the eighteenth century, Chinese power regained possession of it. Altı Shehr, or the six cities, forms the western district, comprising Yarkand, Kashgar, Khotan, Aksu, Yanghsar and Oosh-Turfan, with territories subordinate to each. Eastern Turkestan is eminently mahomedan. Yarkand is the entrepot of trade between China and Bokhara. Khotan, from the time of Ctesias, has been celebrated for its mineral products, its jade and emeralds, its shawl, wool and flax. It was at one time the entrepot of a vast trade with Hindustan, and now imports largely furs, broad cloth, leather, and sugar. See India, p 317, Kabul 435, Kafir, Kunawar, Ladak.

CHINGLEPUT, a town in India in L 80° 3' E, and L 12° 39' N. It is the head town of a collectorate in the Madras Presidency, of the same name, formed out of a tract of land 120 miles long and 45 miles broad, given in A D 1763 to the E I Company as a jaghir by the nabob Mahomed Ali, Wajjah. It is poor land irrigated from tanks, several of which at Carangoly, Chembumbaukum, the Red Hills and Chingleput are very large. It has the Palar and Adyar rivers, and its chief towns are Madras, Poonamallee, St Thomas' Mount, Pulicat, Chingleput and Sadras. The pagodas of Mahabalipuram are in this district. Population about 583,462.

CHINKARA HIND of European and Native sportsmen in India, is the "*Gazella dorcas*." It is met generally on the plains and low open hills of India. In many parts it especially affects the nullahs and stony eminences which diversify the plain. The horns of the male are annulated, and twist back with a slight but graceful curve. They are ten or twelve inches in length. The doe has horns also, but much smaller in every way than those of the buck. They are not annulated, and are sometimes strangely distorted, without any approach to regularity of appearance. They roam in herds of six or eight, but they are more abundant in the province of Cutch than elsewhere, and the antelope is not seen there though, across the gulf, on the coast of Kattia-war, they abound.

CHINNA MASTAKA, in hindu idolatry, is a form of Parvati as Kali, and, possibly, is

the *sakti* of Siva, in the form of Kāpālī. She is described as a naked woman with a necklace of skulls. Her head is almost severed from her body, and her blood is spouting into her mouth. In two of her hands she holds a sword and a skull. In a note on this subject, in Mr Ward's work, it is stated that this goddess was so insatiate of blood, that not being able at one time to obtain enough of that of grunts, she cut her own throat to supply herself therewith—Ward derives the name from Chinnua, cut off, and mastaka, a head. *Cole Myth Hind* p 94. Fast-printed calicos, of different colours, impressed upon a white, or light coloured ground. The word is of Indian origin and is from Chintz, a spot, or spotted. In the Madras Presidency, the principal sites of this manufacture are the towns of Masulipatam, Arnee and Sydapet. Those of Masulipatam are called "Kalan laurea," literally "firm colour," they are of various hues. Each piece is 2 cubits in breadth, and 12 in length, priced at from 4 to 12 rupees each, and it is used for under garments by Hindoo women. Those of Arnee, and Sydapet are ordinary, and 8 by 2 cubits sold at 1 to 3 Rupees each, they are used for pillow covers and other purposes, as well as the under garments of humbler native women. At the Madras Exhibition of 1855, the chintzes from Masulipatam were of great variety as to color, size, quality of the dye and price. The whole collection was interesting, very well colored, and the dyes good, there was a palempore by Aga Ismail of Masulipatam, embroidered in gold and of a chaste and elegant pattern. Some of the chintzes of Masulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour.—*McCulloch, Mr. Faulkner, M. E. J. R. Dr. Watson.*

CHIN ZOOAY. BURM. ? Meaning Elephant's-teeth. A wood of maximum girth, 1½ to 2 cubits, maximum length 10 feet, abundant on the hills inland, always on rocky barren ground, in mountainous or hill districts all over the Tenasserim provinces. When seasoned, sinks in water. This wood is believed by Captain Dance to be the hardest and strongest known in these latitudes, perhaps anywhere in the world. It is, however,

only procurable in such rocky spots as no other tree will grow in, so must be sent for on purpose. It cuts up, as yendruk and other hard woods do, with huge cracks through it, in fact, this is the most wasteful of all known valuable timber in this respect and the original scantling is but small, so that it is not available for general purposes, but is valuable for the edges of Phillester planes, for spoke shaves, and for purposes in which much scantling is not required — *Captain Dance*

Creata		

**Chiretta**, or Creat or Chirayta, for all three pronunciations are in use, is the name given to several plants, all of them closely allied in medicinal properties to gentian, for which several of them are perfect substitutes. Like gentian, Chiretta promotes digestion, improves the appetite, and gives a tone to the system, without producing much stimulant effect, or causing constipation. It contains a resin and yellow bitter matter, on which the activity of the plant depends. Its use is admissible in all inflammatory states of the intestinal canal, and in febrile diseases. The chiretta of the bazars is the produce of the several following plants —

*Adenema hyssopifolia* HIND Chota Chirayta, is common in various parts of Southern India, is very bitter, also somewhat laxative, and much used by the natives as a stomachic

*Agathotes chirayta* (Don), *Ophelia chirayta* (Grisebach), *Gentiana chirayta* (Fleming), BENG and HIND *Chnata*, grows in Nepal, the north of India, and Morung Hills. All parts of the plant are extremely bitter, and are identical in composition with the common gentian. It is highly esteemed as a tonic and febrifuge all over India. It is a common and abundant plant in the bazar, supplied chiefly by the lower ranges of the Himalaya

*Andriographis paniculata* (*Justicia paniculata*, Roxb) BENG Kalamegh, HIND Kalupnath or Maha tita, is the genuine or original chiretta

*Chironia centaurioides* of Roxburgh (*Erythraea Roxburghii* (Don), is another and powerfully bitter plant found in India

*Circindia hyssopifolia* (Syn *Exacum hyssopifolia*) common in various parts of the East Indies, the whole plant is bitter and somewhat laxative, is used by the natives as a stomachic

*Eracum bicolor*, grows rare on the Neilgherries, below Kotaghenry, and abundant a mile below Nedawntum, where it flowers during the autumnal months. This species enamels the swards of the Western Ghauts with its beautiful blossoms, has the same bitter stomachic principles for which the *Gentiana lutea* is so much employed, and it is believed, may be used with advantage in lieu of gentian for medicinal purposes. The infusion is a mild pure bitter. It is known in Mangalore as country creat, and sold there at 1 anna 6 pie per lb

*Exacum tetragona*, is another species of this genus, and is called *Ooda chiretta*, or purple chiretta.

*Halenia*

*Ophelia angustifolia* (Don), O. Sweetia

(Royle), is called *pukarnee chiretta*, and is substituted for the true *chiretta*.

*Ophelia elegans*, (Wight), grows plentifully in several parts of the Madras Presidency, is considered febrifuge by the native physicians, who prefer it to the Himalayan *chiretta*. It grows plentifully in the Jeypoor zemindary of Vizagapatam, and is annually exported, as *Silaras* or *Selajut*, to the value of about Rupees 2,500. The infusion of *O. elegans* has a powerful bitterness.

*Ophelia alata* and *Ophelia chiretta* seem to be used similarly, they grow in the Himalaya.

*Villarsia indica*, *V. aristata*, and *V. nymphaeoides*, occur in every part of India.

*Chiretta* may be regarded as a type of the simple bitters, so many of which have been employed in Europe as febrifuges. For such purposes it is employed in India, and it will do whatever a simple bitter can in stopping intermittents. This is of course not very much, at least in the tropics, notwithstanding the opinions of physicians of a past age, for instance Boerhaave, who had great faith in gentian. *Chiretta* is an extremely useful tonic, and of much service in convalescence from fever. It is one of the few articles of the Indian Materia Medica, which is in every respect an adequate substitute for the corresponding European article, and there is no occasion for any gentian being imported into India, although Twining, with the fondness for particular remedies which is engendered by exclusive modes of practice, imagined that extract of *chiretta* had not the peculiar virtues which he attributed to gentian in dysentery. *Chiretta* is a useful vehicle for other remedies, and not long ago infusion of *chiretta*, with powder of gall nuts, was tried as a fever remedy in dispensary practice, but with indifferent success. Probably *chiretta* by itself would have been quite as efficacious. *Chiretta* is given in infusion and tincture like gentian. It is the basis of the celebrated *drogue amere*, a compound of mastic, frankincense, resin, myrrh, aloes, and great root, steeped in brandy for a month, and the tincture strained and bottled. *Chiretta* is met with in a dried state, tied up in bundles, with its long slender stems of a brownish colour, having the roots attached, and which have been taken up when the plant was in flower. The whole plant is bitter, being universally employed throughout India as gentian is in Europe. It is procurable in all native druggist shops—(Faullner). The extracts of *chiretta* agree in being valuable bitter tonics. Both these and gentian contain a peculiar principle termed the gentisic acid. The dose is ten to thirty grains twice or three times

daily, usually prescribed with sarsaparilla hemidesmus or iron.—(*Beng Phar*, p 290). The wine of *chiretta* is cordial, bitter and tonic in a dose of two fluidrachms. A compound tincture of licat is prepared by licat root six ounces, myrrh and aloes, each one ounce, French brandy two pints, macerate for three days and strain. This preparation is equivalent to the celebrated "*drogue amere*". Its effects are tonic, stimulant, and gently aperient. It is a valuable preparation in the treatment of several forms of dyspepsia and torpidity of the alimentary canal in a dose of one fluid drachm to half an ounce.—*Faullner Beng Phar*, p 290, 429. *On the Varieties of Chiretta used in India*, by Hugh Cleghorn, M D, Madras Medical Service Dr J L Stewart.

CHISHOLM, Miss Caroline, daughter of  
 Mr William Jones of Wootton in North-  
 amptonshire, was born about 1810 She  
 was married to Captain Alexander Chisholm,  
 of the Madras army On her arrival in  
 Madras, she was the means of establishing  
 an industrial home or school, afterwards, while  
 residing at Sydney, she devoted herself to  
 protect the young women emigrants, and in  
 all her efforts she was warmly seconded by  
 the local press She established a store,  
 and constituted herself a mother to the friend-  
 less women, making frequent journeys into  
 the interior of the country to form committees,  
 and placing the young people to service She  
 returned to England to become the champion  
 of the cause of emigration, where she aided  
 many to emigrate, and finally established  
 the Family Colonization Loan Society, and  
 sent out ship after ship with emigrants, cared  
 for in a manner never before attained, she  
 returned to Sydney in 1854, where she was  
 received with great honours

CHIT, in the doctrines of the Sri Sam-  
 pradaya sect of hindus, means the "spirit"  
 of Vishnu, this, with "achit" or matter and  
 ishwarra or god, or ruler, being the three predic-  
 ates of the universe In their views, Vishnu  
 is Brahma, before all and creator of all See  
 Sri-Sampradaya

CHITA HIND MAHE A native name for  
 the several leopards and panthers or spotted cats  
 of India The word is also written Cheetah  
 There are several the panther, leopard, black  
 cheetah and hunting cheetah The hunting  
 Chita, or *Felis jubata*, is carried near to the

herd of deer in a cart, from which it is shipped. It first walks towards the antelope, with its tail straightened and slightly raised, the hackle on its shoulder erect, its head depressed, and its eye intently fixed on its prey, which does not as yet perceive him. As the antelope moves, the Chita does the same first trotting, then cantering after it, and when the prey starts off, the Chita makes a rush, to which the speed of a race-horse is for the moment much inferior. The Chitas that bound or spring on their game are not so much esteemed as those which run it fairly down. The Chita, if it miss its first aim, stops and gives up the chase, walks about for a few minutes in great rage, after which it again submits to its keepers. It always singles out the biggest buck of the herd. Some leap on the neck, another holds the deer by the throat till the animal is stifled, keeping the hind feet on the horns to secure itself from injury. See Cheeta.

**CHITTAGONG**, also called Islamabad, in L 22° 20' 5 N, L 91° 44' 1 E, is a town 7 miles from the mouth of the river of the same name Flagstaff hill is 151 feet above the sea. It is a large town of mahomedans and of Mugs, a Burmese tribe, who inhabit many parts of the Malay peninsula and the coast to the northward of it. In the time of James II the E I Company, in 1690, obtained the king's permission to send Admiral Nicholson with 12 ships of war, 200 pieces of cannon, and 600 men, to seize and fortify Chittagong and establish a kingdom, but this proved a failure, and fresh troops were sent out under Captain Heath, who burned down Balasore and proceeded to Chittagong. But finding this too strong, he sailed to Madras, which, with Bombay, were the sole possessions remaining to the English. But at this time, Amungzebe accepted the terms of peace which the English offered, and allowed them to return to trade. The town stands on the north shore of an extensive delta, formed by rivers which issue from the lofty mountains separating this district from Burmah, rising 4,000 to 8,000 feet, they are forest-clad, and inhabited by turbulent races, conterminous with the Kuki of the Cachar and Tipperah forests, if indeed they be not the same people. The mountains abound with the splendid timber-trees of the Cachar forests, but, like these, are said to want teak, sal and sisso, they have, besides many others, magnificent gurgul trees (*Dipterocarpi*), the monarchs of

the forests of these coasts. Chittagong manufactures inferior fabrics of strong texture. An inferior sort of isinglass is prepared and sold to Chinese traders (*Dr Taylor*). The natives are excellent ship-builders and active traders, and export much rice and timber to Madras and Calcutta. The town is large and beautifully situated, interspersed with trees and tanks, the hills resemble those of Silhet, and are covered with a similar vegetation. On these the European houses are built. The climate is very healthy. Arracan, only 200 miles further south, is extremely unhealthy, and has many mangrove swamps. To the south of Chittagong undulating dunes stretch along the coast, covered with low bushes, of which a red-flowered *Melastoma* is most prevalent, and is considered a species of *Rhododendron* by many of the residents. But in addition to *Melastoma*, there occur the Jasmine, Calamus, *Ægle marmelos*, *Adelia*, *Memeeylon*, *Ixora*, *Linostoma*, *Congea*, *Chimbing Cæsalpina*, and many other plants, and along their bases large trees of Amoorra, Gaiea, figs, Mesua, and *Micromelon*—*Hooker Him. Jour Vol II page 345, 347*. The Chittagong wood (*Chukriassia tubularis*) is more used at Madras in the making of furniture than other woods. It is light, cheap and durable. Wild coffee grows abundantly in the Chittagong hills. Cultivated coffee is of excellent quality. The hill-tribes of Chittagong have been pushed up from Arakan. They call themselves by two names of pure Arakan origin—the Kyoung tha, or sons of the river, and the Young-tha, or sons of the hills. The latter, to which the Losshai belong, are the more savage and independent, as their name would lead us to believe. The former have a written language and even possess several copies of the *Rajah wong*, or History of the Kings of Arakan. All are Mongolian in physique, and are probably of Burmese origin. "They have an honest bright look, with frank and merry smile and their look is a faithful index of their mental characteristics." They live in bamboo houses raised above the malaria of the ground. They practice *joom*, *cheena*, or *Kumari* cultivation, burning down the jungle to prepare the soil for mixed seed scattered broad-cast, and moving off to a new site next season. And they have a mild form of debtor slavery, which Captain Lewin thinks we have too suddenly interfered with, so that the hillmen fall victims to the usurer. Among the independent tribes beyond the British border, prisoners of war are sold like cattle. Their wives are procured, while raids are also caused, by the usage of "wehrgeld," which they call "goung bpo"

on the price of a head When a villager dies, his friends charge the village which he may have last visited with his death, and demand a price for his life Polyandry, however, does not seem to exist among these tribes, though the women are so overworked and thus rendered so liable to disease that it might have been expected Raids for women seem to keep up the necessary supply Captain Lewin, in his Report, draws many a charming picture of rural courtship As among almost all the non-Aryan tribes, chastity is enforced only after marriage All the unmarried lads sleep in one house in the village under the care of a "going" or head man The merry-makings and customs which are connected with this "bachelor's hall," as Colonel Dalton calls it, are the same as in the Kol and Ghond countries In the hills marriages are unions of affection, not of convenience or interest Girls marry at 16, lads at 19 The most favourite offerings to a sweet-heart is a flower, and the lover will often climb the hills before dawn to procure the white or orange blossom of some rare orchid for the loved one's hair It may be mentioned, in passing, that the hair, being neither cut nor washed, but increased by a *chignon*, is indescribably filthy, and that one of the most curious legends of the people relates to the introduction of the louse by Bengalees The girls know how to make modest advances One of Captain Lewin's police sought a week's leave of absence on this ground—"A young maiden of such a village has sent me flowers and *birnee* rice twice as a token, and if I wait any longer they will say I am no man" The language of flowers is well known among the Kyoung-tha A leaf of pawn, with betel and sweet spices inside, accompanied by a certain flower, means "I love you" If much spice is put inside the leaf, and one corner turned in a peculiar way, it signifies "come" The leaf being touched with turmeric means "I cannot come" A small piece of charcoal inside the leaf is "Go, I have done with you" The love songs are as pure as they are pretty, and no improper ditties are allowed in the hearing of the village maidens As the lads and lasses work in a crowd, at harvest times, they respond in chorus, or when the leader has finished, the whole party break out into the *hora* or hill call, like the "jodel" of Switzerland, and the cry is taken up from hill to hill till it dies away in the distant valleys In their mode of kissing, instead of pressing lip to lip, they apply the mouth and nose to the cheek and give a strong inhalation They do not say, "Give me a kiss," but, "Smell me"

The religion of these tribes is a mixture of

Buddhism and nature-worship Captain Lewin describes a festival at the Mahamunnee temple in Arakan The bamboo is adored by some as the impersonation of the spirit of the forest But wherever, as in the case of the Chukma, the tribes come into contact with the Bengalee, they show a tendency to gravitate towards hindooism, the caste of which would soon kill the joyousness and check the freedom of their life The Khumia and Kuki tribes occupy the hills of Sylhet, Tipperah, and Chittagong, the Kuki at the tops of the hills and the Khumia on the skirts The Kuki are the ruder or more pagan race, though also tinctured with hinduism They term their chief deity Khojein Putiang, to whom they sacrifice a Gyal, and to an inferior deity named Shem Saq, a rude block of wood put up in every quarter of a village, a goat is offered, and they place before it the heads of the slain in battle, or the heads of animals killed in the chase The Kuki say that they and the Mug are the offspring of the same progenitor

CHITTI or CHETTI, Plural Chettiar, the traders and shopkeepers of Madras. Many of them are of small stature, but they are fair coloured. They are intelligent and successful business men, and a few have lately entered into commercial transactions to distant countries. Their wives dress with the Sati, but only of late years have any of them adopted the choli or bodice. A Sudra naidoo, the late Lutchmenaisu Chettiar, member of the Legislative Council of Madras, took this title. None of them have ever had any political relation with the native states.

CHITTIPIUL HIND Heliotropium brevifolium

CHITTOOR, a town in India in L. 72° 11' E and L 13° 14' N. It is in the North Arcot collectorate.

CHITTORE, a town in Rajputana in the kingdom of Mewar. Its dynasty are rajput, and claim to be descended from Lob, the eldest son of Rama, of the Solar dynasty. They say that they were first ruling at Bilahipura, a city in the gulf of Cambay, but their capital was laid waste by a son of Nousherwan of Persia in A D 524. The Rajput queen escaped the general destruction and gave birth to a son named Goho, from whom the Rajas of Oodeypur are descended. Goho established the kingdom of Ednr and eight princes succeeded him on the throne. The race seem to have remained in the desert till the middle of the eighth century, but in A D — ? Bappa took Chittoire. Shortly afterwards Bappa proceeded to Saurashtra and married the daughter of Esupgole, prince of the Island of Buunderdhiva. With his bride he conveyed to Chettore the statue of *Vyan-mata*, the tutelary goddess of her race, who still divides with Eklinga the devotion of the Gehlote princes. The temple in which he enshrined this islandic goddess yet stands on the summit of Cheetore, with many other monuments assigned by tradition to Bappa. Bappa is not a proper name, it signifies merely 'a child'. He is frequently styled Syeel, and in inscriptions, Syeel Adhes, 'the mountain lord'. The

Mori prince, from whom Bappa took Cheetore, was of the Tak or Takshac race, of whom Nagnecha, Nagam Mata, was the mother, represented as half woman and half serpent, the sister of the mother of the Scythic race, according to their legends. Of the twenty-four Gehlote tribes, several issued from the founder Bappa retired into Scythia and left his heirs to rule in India. Kencksen was the founder of the Balabhi empire, and Sumitra was the last of Rama's line. Many rites of the Rana of Mewar's house are decidedly Scythic. According to Sir H Elliot when Mahomed bin Kasim, the general of Walid, overran Guzerat about A D 718, and advanced to Chittore, Bappa met and entirely defeated him, and after this Bappa was raised to the throne of Chittore, where his descendants still reign. After a long and prosperous reign, Bappa abdicated and departed to Khorassan. In the reign of Khuman his great grandson Mahmud, Governor of Chorassan, invaded Chittore, but was defeated and expelled by Khuman after 24 engagements. Baber sustained a great defeat at Futehpore Sikri at the hands of the rajput Rama Singha, chief of Chittore, but in 1527, Baber led his army a second time against the Rajput prince, whom he overtook and completely broke his power. While ruled by Oody Singh, Chittore was invested by the emperor Akbar and captured after a prolonged siege, Oody Singh, at the approach of the imperial army, withdrew to the Aravalli hills, and left Jeymul, the rajput chief of Bednore, to defend his kingdom; Jeymul, with 8,000 of his men and women, perished on the occasion, and 74½ maunds of plunder were taken away by the army of Akbar. The capture of Chittore was regarded at the time by the rajput race as the greatest of misfortunes, and they have perpetuated the remembrance of it by impressing on all their correspondence the figures 74½. Oody Singh did not reoccupy Chittore, but founded Oodeypore, which he made his capital—*Elliot Hist of India Tod's Rajasthan, Vol I p 594*. See Balabhi, Hindoo, Mewar, Saurashtra.

CHLORANTHUS, a genus of plants belonging to the natural order Chloranthaceæ — White gives *C Indicus*

CHLORANTHUS BRACHYSTACHYS is a native of the coast of Java Its properties are like those of *C officinalis* —*Engl Cyc page 1052*

CHLORANTHUS OFFICINALIS is a smooth shrub 3-4 feet high, with opposite straggling branches, tumid at the articulations, fistular when young The plant is a native of Java, in the moist woods, at an elevation of 1,500 feet above the level of the sea All the parts are powerfully aromatic; the roots, if quickly dried, retain their properties for a longtime, and the mountaineers of Java employ

them in infusion as a remedy for spasms, also when united with anise or *Ocimum* it is given in small-pox In fevers and a suppression of the functions of the skin it is said to be of the greatest service It is no doubt a powerful and active stimulant —*Engl Cyc page 1052*

CHLORATE OF POTASH, Syn of oxy-muriate of Potash

CHLORIDE OF LIME, a white powder of lime in which chlorine gas is mechanically mixed It is used as a disinfectant and bleaching powder

CHLORINATED SODA, a solution of this is Labarraque's disinfecting fluid, the Liqueur soda chlorinatæ To make it, take of carbonate of soda one pound, water forty fluid ounces dissolve and pass through the solution chlorine gas evolved from peroxide of manganese three ounces, common salt four ounces, sulphuric acid four ounces This mixture may be placed in a leaden retort and gradually heated, the gas should first be passed through five ounces of water in an inverted bottle It contains chlorous acid and carbonate of soda The colour of the liquid is pale yellow, smell that of diluted chlorine, it bleaches powerfully, and is used in fumigation, and for destroying the smell of decaying animal matters —*Beng Phar p 363*

CHLORIDE OF SODIUM See Soda Chloridum

CHLORIDE OF ZINC Captain Keppell believes Sir William Barnett's solution of chloride of zinc, properly applied, the only composition yet known that will preserve anything from the white ants. —*Keppell's Ind Arch, Vol II, p 189*

CHLORINE To prepare a solution of this, take muriate of soda sixty grains, sulphuric acid two fluid drachms, red oxide of lead three hundred and fifty grains, water eight fluid ounces It is used for bleaching, also for inhalation, and for the fumigation of infected apartments —*Beng Phar p 369*

CHLORITE Grains, or lamina of chlorite, are found in connection with tin

CHLORITE SLATE, portions of the beds of clay slate east of Tavoy, contain chlorite slate It is the Moongnee stone of Orissa, which when freshly quarried, is comparatively soft and easily workable, but by long weathering becomes highly indurated, black and bright It comes from the hill state of Nilgiri, in Orissa, where extensive quarries are said to exist It is used for utensils and idols The Aroon Khumba, a polygonal column in front of the principal entrance of the Pooree Temple, is made of it, also the elaborately carved and figured slabs of the top and sides of the doorways of the old

Temple of the Sun at Kanarac in the same district, and the gigantic figures of deities of Jagapore, in the Cuttack district. It is supposed, however, that Moongnee is a general term applied to several kinds of stones, of which Kalree 'Moongnee' is one — *Cat Ex p 62*

CHLOROPHYLL is a substance similar in its nature to wax. It is contained in the deep cells and mesophyllum of leaves *Winslow*. See *Cannabis sativa*

CHLOROXYLON DUPADA HAM Syn of *Vateria indica*. See *Resins*. Dammer

CHLOROXYLON SWIETENIA *Roxb*, *W & A*, *D C*

*Swietenia chloroxylon Roxb*

Satan wood	ENG	Porasham	TAM.

Mududa	TAM	Bhayloo	"
Vum-maa	"		

The Satin wood tree grows in Ceylon, in the northern and southern, but chiefly in the eastern, districts, where it attains a large size and is esteemed next to the Calamander in value. It grows in Coimbatore, in the Anamallai hills, where, latterly, Dr Wight got planks 15 inches broad. Indeed, some of the finest satinwood to be any where seen is to be met with near the foot of the Anamallai, though, even there, this valuable wood is rapidly disappearing under the cultivator's axe. It grows at Gokak. Dr Gibson, writing from the Bombay Presidency, says he had never seen it reach beyond the size of a small tree, which, when straight (seldom the case), would afford a log squaring three inches. It is a rare tree, also being, in so far as he had seen, found only in the Padshapoor jungles, and in those of the upper Mool, in the Ahmednugur collectorate. In the coast forests he had never seen it. Dr Cleghorn, in the M E J Reports, says the tree grows abundantly in the mountainous districts of the Madras Presidency, but seldom attains a large size, though occasionally planks of 10 to 15 inches in breadth may be procured. In Ganjam and Gumsur its extreme height is 40 feet, circumference 3 feet, and height from the ground to the intersection of the first branch 20 feet. The tree is not so common in Gumsur as in Bodo godo, and it is said to be still more plentiful in Mohery and other talooks to the south. The Billu Karra of the Circars, says Mr Rohde, is a most serviceable hard wood, well suited for naves of wheels, and, were it procurable in any quantity, for all frame work requiring strength and durability. The Peradenia bridge, a single arch of 205 feet on the road to Kandy, was designed for and principally executed in this wood. The wood

is very close grained, hard and durable, of a light orange colour, takes a fine polish, and is suited for all kinds of ornamental purposes, but is somewhat apt to split. For picture frames it is nearly equal to American maple. The timber bears submersion well, in some instances it is beautifully feathered. The flowered or feathered satin wood, when first polished, is one of the most beautiful woods in the world. Mr Rohde has seen specimens surpassingly beautiful, but, the valuable logs are not distinguishable from ordinary satin wood till sawn, and twenty or forty may be cut without one of any beauty being found. The feathered satin wood seems very liable to sever when dry and old. Articles of satin wood get darker and lose much of their beauty by age, unless protected by a coat of fine varnish. A cubic foot weighs 55 to 57 lbs. It is used for axle trees, oil presses, posts, bed posts, rafters and the handles of axes, and, in the Madras Gun Carriage manufactory, for naves of wheels, also for fuses. The leaves are applied to wounds. The wood is heavy and strong, and reckoned very excellent for pieces of agriculture implements. Latterly it has been much employed in Madras as fuses, internal decoration and furniture, brushes, turnery. It is excellent for naves of wheels. Dr Gibson had not seen it used in cabinet work in the Bombay territory — *Dis Gibson, Wight, Cleghorn, Mr Rohde, Mr. Mendis, Roxb n 400, Hartwig Thw 1 61.*

CHO. HIND *Pyrus malus*

CHOANA See *Arians*

CHOARGERRYDROOG, in L 77° 10' E and L 13° 54' N

CHOASPES, the ancient name of the river on which Susa, in Khuzistan, was built. It is the modern Kerh river, near which are the ruins of Susa — *Williams' Essays, p 13.*

CHOB HIND A stick, a pole, timber, a mace. Chob-dar, a mace-bearer. The chob is made of silver, ivory or wood. It is probable that the office of gold stick, adopted in the English court, was borrowed from the East. Most men of rank in India, hindu, mahomedan, or British, retain this description of attendant, mostly however bearing a silver stick, but having the common name of Chobdar, or staff-bearer. The chob, or baton, is about five feet long with a head, and as thick at the upper end, as one's wrist, or as a constable's staves. (Mai) Chob is the *Staphylea emodi*, (Siyah) Chob is a species of *Fraxinus* — *Hindu Infanticide, p. 133.*

CHOB-CHINI GUZ HIND *Smilax China*, China root

CHOB-IPAU PERS *Fothergilla involu-crata*

CHOB KUT. HIND. *Costus* or scented root.

CHOBS ?—*Campanula edulis*

CHOCHENA URUA ? A tree of Ganjam and Gumsur Extreme height 60 feet, circumference 5 feet, and height from ground to the intersection of the first branch 9 feet Chiefly used for firewood, the tree being tolerably common The bark is used medicinally in fever The milk is given medicinally to children in a disease there called "Doobelle"

—*Captain Macdonald*

CHOCHHI HIND ? A tree of Chota Nagpore, yielding a hard, reddish grey timber — *Cal Cat Ex* 1862

A nutritious article of diet manufactured from the nuts of the *Theobroma cacao* and Tricolor of the western hemisphere It reaches India in the various forms of chocolate mbs, flake chocolate, soluble chocolate, and flake cocoa — *McCulloch*

CHODMAL HIND Brassica, *Species*

CHOECARPUS PUNGENS ??? Hedde woke SINGH Under these names, is mentioned a tree of the western province of Ceylon Its wood weighs lbs 58 to the square foot, and lasts 50 years It is used for common house building purposes — *Mendis*

CHCENOSTOMA POLYANTHUM Ore of the Scrophulariaceæ, pretty dwarf plants, of a white and light yellow colour, well adapted for borders, and thrive in any garden soil

CHCETOCARPUS CORIACEUS THW A moderate sized Ceylon tree, common — *Thw En Pl Zeyl* p 275

CHOGA, a long great coat in use in Afghanistan, which reaches to the feet The "Postin, also an overcoat, comes down to the middle of the thigh By wearing a turban, or kajar cap, and a common ehoga over ordinary clothes, European travellers in those countries avoid much annoyance — *Fernier, Journ Adventures of a Lady in Tartary, &c Mrs Hervey Vol I, p 356*

CHOGU HIND *Taxus baccata*

CHOHA HIND A well

CHOHAN, or Chahuman, one of the Agmeula tribes, which formed a dynasty that reigned at Ajmir and Delhi, and afterwards at Kotah and Bundi Ajpal, one of this dynasty, founded Ajmir in A D 145, and in A D 684, it was lost to the mahomedans by Dola Rai. A D 77 Harihara Rai defeated Subaktegin The race has been conspicuous for bravery during two thousand years. The leading individuals have been—

Anhul or Ajnapala, "offspring of fire," the first Chohan, probable period 650 before Vicrama, when an invasion of the *Turshka* took place, established Maevati nagri (Gaira Mundilla), conquered the Konkan, Aser, Golconda

*Suvatcha Mallan* In all probability this is the patriarch of the Mallam tribe

*Gulun Soor, p 202 Ajipala "Chulwa,"* or universal potentate, founder of Ajmer Some authorities say, in 202 of the *Vurama*, others of the *Vrat-Samvat* the latter is the more probable

*Dola Rai* Slain, and lost Ajmer on the first irruption of the mahomedans, S 741, A D 685

S 741 *Mamla Rai*. Founded Sambhur - hence the title of Sambhri-Rao borne by the Chohan princes, his issue

S 827 *Huray* Defeated Nazir oo din (qu Soobaktegin?), thence styled 'Sultan-graha'

*Beei Beelundoo*, or Dheirmagnj, slain defending Ajmer against Mahmood of Ghizni

S 1066 to 1130 *Beeuldeo* (Classically, Visaladevi), his period, from various inscriptions, S 1066 to S 1130

*Sarangdeo* Died in nonage

*Anah* Constructed the Anah Sagur Ajmer, still bears his name

After Anah, were Jeipal, Ajeydeo or Anundeo, and Someswar Someswar married Rooka Bae, daughter of Anung Pal, Tuar, king of Delhi, and their son Prithi-raj, succeeded to the throne of Delhi, and is said to have been slain by Shahabud-din S 1249, A D 1193. His son Ranasi also fell Vijaya raj, son of Someswar, whose name is on the Delhi pillar, was a nephew of Prithi raj, and was adopted as his successor, his son Lakunsi had twenty-one sons, seven of whom were legitimate, the others illegitimate and founders of mixed tribes From Lakunsi there are twenty-six generations to Nonud Sing, the late chieftain of Neemana, the nearest lineal descendant of Ajpal and Prithi-raj

The genealogical tree of the Chohans exhibits thirty nine princes, from Anhul, the first created Chohan, to Prithi-raj, the last of the hindu emperors of India

The mahomedan historians say that Prithi-raj was killed at the battle of the Cuggur, or shortly afterwards, but Chand, or rather his continuator, represents him as dying in captivity at Ghuzni, and the bard would gladly have concealed so humiliating a fact if he could Several Chohan sepoys after the capture of that fortress, sought out, and professed to find, the Chhutree of their ancestor, where they shewed their devotion to his memory by presenting their humble offerings in honor of

the champion of their faith The desert tribes in the Chohan territory, the Sahrai, Khossa, Koli, Bhil, were predatory The western Chohan are said to be free from infanticide, they do not wear the zonar, nor form a circle (choki) in cooking, and then cooks are usually of the barber caste Boondi and Kotah are the most celebrated of the existing Chohane Twelve branches of the Chohane became mahomedans — *Prinsep's Antiquities by Thomas*, p 248 *Tod's Rajast Elliot, Supp. Gloss*

CHOHAR or CHOAR A tribe of mountaineers in the hills of Rangarh, &c — *Wilson*

CHOHUR, a river near Serohee in Rewah

CHOI HIND Also Jira, Hind, a hole in the bed of a river, to get water — *Elliot*

CHOI, the outer leaf or spathe of the sugar-cane

CHOIGYAL Tib Dharmaraja, the judge of the dead, Shin-je, Tib. is also said to have the same meaning

CHOIL Punjab of Cis-Sutlej, low, swampy, undrained land.

CHOITRO, a hindu month corresponding to the latter half of the month of March and first half of April, the full moon of Choitro therefore corresponds with the full moon of Easter It was in this month that the devotees engaged in the ceremonies of the Charakli puja, the swinging sacrifice

CHOITUNYA, a hindu religious reformer, who founded the Gossai sect He was born at Nuddea in Bengal A D 1485 He was the son of a Bardik brahman who had removed from Sylhet to Nuddea The age in which he was born had been preceded by one of great religious reforms and innovations There had been Ramananda who had revived the anti-caste movement, and Kabir who set aside alike the hindu Shastars and the Koran and preached a universal religion In Bengal, buddhism had maintained its supremacy up to the tenth century On the accession of the Sena princes, Saivism gained the ascendancy and predominated in the land Under coalition with Saktaism, the worship of the emblems of the energy of man and the fruitfulness of woman, it had degenerated to the most abominable creed of the Tantio Shastras which culminated in the worst forms of libertism about the time of Choitunya Two thousand years ago had a greater reformer viewed with disgust and a relenting heart, the bloody rites and sacrifices of the Vedic Yagya and to reform the abuses had Buddha promulgated the doctrine of non-cruelty to animals In like manner, the bacchanalian orgies of the Tantrika, and their worship of a shamefully exposed female, had provoked the abhorrence of Choitunya, and roused his energy to remove the deep blot upon the national character He com-

menced his labours by holding meetings of his immediate friends at the house of Sree Bhasa His labours lasted through six years, when he entrusted his disciple Nityananda to propagate his views, and it is to Nityananda that the origin of the Gossai is owing In 1509, Choitunya, styled Nemye, formally renounced the world by embracing the life of an ascetic He then wandered from place to place, travelled to Gour, proceeded to Benares, visited Brandabun and Pooree, teaching his sentimental theology, making numerous converts, and devoting all his energy, time, and life to the fulfilment of his mission His peregrinations lasted for six years at the end of which he returned to Nilachull near Juggernaut, and settling there passed twelve years in an uninterrupted worship of that divinity In his last days his intense enthusiasm and fervour affected his sanity, and he is said to have drowned himself in the sea under the effects of a disordered brain

Hindoos of all castes are admitted into Choitunya's fraternity, and, once admitted, are associated with on equal terms by all the brethren His predecessors Ramanand and Kubeer, had taken low-caste men for their disciples But he scrupled not to permit even mahomedans to enter his fold, and two of his most eminent followers Rupa and Sonatun were originally mahomedans, ministers in the court of Gour

The Gossai mairi, most of the Banali of Bengal follow their tenets, but their doctrines are held in little esteem They are regarded as guru or teachers, but scandal has not arisen from them The Gosaees observe none of the hindu festivals except those of Krishna, but the anniversaries of the deaths of their founders are observed as such They do not, says Mr Ward, reject the mythology, or the ceremonies of the hindus, but they believe that those of Huree (Krishna) only are necessary On the nights of their festivals the initiating incantation, or some similar exclamations, may be heard resounding through the streets of Calcutta Huree, Krishna, Huree, Krishna, Krishna, Krishna, Huree, Huree, Huree, Ram, Huree, Ram, Ram, Ram, Huree, Huree" — *Cole Myth Hind* p 240 See Chaitanya, also Chaitnu

CHOK HIND *Gmelina arborea*

CHOKA HIND *Rumex vesicatoria*

CHOKA DUK Pipei nigium

CHOKKE DAMP ENG Carbonic acid

CHOKHA The root of a plant that is brought from Delhi to Ajmere, it is heating. taken internally as a narcotic, is bitter It is chiefly used mixed with sulphur and oil to cure the itch in camels — *Gen. Med. Top.* p. 131

**CHOKHADAR** In India a watchman, a policeman The Chokhadar or Ich Agasi of the pashalic of Bagdad, is one of the pages of the pasha's presence — *Mignan's Travels*, p 6109

**CHOKI SHUE MUT PHYA**, L 23° 4' N L 96° 15' E in Burmah, 2 miles N of Amarapura. It is 579 feet above the sea — *Schl A O*

**CHOKLU HIND** *Rhus succedanea*

**CHOLA**, an ancient dynasty in the south of the peninsula of India, regarding whom little has come down to the present day. In the southern districts of the peninsula of India an ancient aboriginal people called Curumber are the earliest known occupants of Dravida Desam, the modern Carnatic and Coromandel. They seem to have established numerous petty principalities over the whole peninsula, which were ultimately absorbed in the Chola empire. Numerous sites attributed to this race and still called Curumber Cotes, are to be met with. Small communities of the same tribe are found to this day in the less accessible hills and forests of many parts of the peninsula. The several capitals of the Chola were at Conjeveram, Wori-ur, Combacoum, Gangondaram, Tanjore. But the whole history of this, the most important ancient power in the peninsula, is involved in great obscurity. We have no authentic information that can be trusted, anterior to the 9th century, yet they must have been exercising sovereignty in the time of Ptolemy, who makes mention of "Aicati soren," and in the Mahawanso, frequent references to transactions with the Chola occur during the earliest periods of the Singhalese annals. The Tamil traditions abound with stories of Adonda Chakravarti, who appears to have been the subduer of the aboriginal or Curumber tribes, yet no trustworthy records of his origin and actions are forthcoming, neither have authentic accounts of the overthrow and extinction of any of the great southern states been yet obtained. The Chola Kingdom at one time reached as far as the river Kistnah. The Ceded Districts formed part originally of the kingdom of the Chola, with whom they were occasionally disputed by the Calyan Chalukya, and ultimately they constituted the principal portion of the kingdom of Bijanagar or Anegundi. The capitals of the latter power were successively Bijanagar on the Tungaboodra, Penaconda and Chandragiri. The ruins of Bijanagar and Chandragiri are extensive and remarkable.

Elphinstone says that the proper limits of the Chola Kingdom were those of the Tamil language, and Mr Ellis thinks that it had attained to this extent at the beginning of

the Christian era, but the same gentleman is of opinion that, in the eighth century, its princes had also occupied large portions of Carnata and Telingana, and ruled over as much of the country up to the Godavari as lay east of the hills at Nandidrug. They seem however to have been first checked, and ultimately driven back, in the twelfth century, within their ancient frontiers. In this state they continued to subsist, either as independent princes or feudatories of Vijayanagar, until the end of the seventeenth century, when a brother of the founder of the Mahratta state, who was at that time an officer under the mussulman king of Bijapur, being detached to aid the last raja, supplanted him in his government, and was first of the late hindu family of Tanjore. The capital, for most part of their rule, was, he says, at Canchi or Conjeveram, west of Madras — *Elphinstone History of India*, p 414 *Prinsep by Thomas*, p 279 *Mr W Elliot*

**CHOLAMANDELOOR**, said to be the source of the term Coromandel, applied to the east coast of the peninsula of India, the Carnatic below the ghats

**CHOLA HIND** ? *Cicer arietinum*

**CHOLAY**, of Nepaul Capia hircus, *Linn*

**CHOLI HIND** A boddice worn by most of the women of British India. It is of various shapes but generally of coloured materials. See Boddice

**CHOLI DUK** *Portulaca quadrifida*, *Roxb. Linn*

**CHOLLA** *Tel Eleusine coracina*, *Gortn*

**CHOLUM** *Tam Sorghum vulgare*

**CHOM-DAN DAS**. See Buddha

**CHOMONDRI**, or Chalembry, the Tamil name of a Ceylon tree, the wood of which is of a very dark colour, and durable. It grows to between twelve and twenty inches in diameter, and twenty feet in height. It is used by the native carpenters for general purposes. It produces a fruit which is used as medicine — *Edye, Ceylon*

**CHOMPENG**, a river cargo boat. The prahu or boat called Sekong, is made of one log of wood, very sharp fore and aft, with long outriggers to prevent its upsetting. *J I Arch Nos vi to xii*

**CHONEMORPHA ANTIDYSENTERICA** Don Syn of *Holaria hena antidyenterica*, *Wall*

**CHONEMORPHA MACROPHYLLA**, one of the Apocynaceæ. It takes its name from *chone* a funnel, and *morpha* form, a very handsome climbing shrub, with large white flowers, well adapted for a screen or covering a wall — *Riddell*

**CHONEMORPHA MALABARICA** Don *Echites malabarica* *Lam* | *Pul-valli* *MALEAL*.

A Malabar plant Its leaves rubbed up in rice water are applied to carbuncles and its root is used in fever, with dried ginger and coriander seed — *Useful Plants*

**CHONG**, an infusion or fermented liquor, made by the Lhopa of Butin, from wheat, barley or rice, which is boiled and strained, afterwards one ball, size of a nutmeg, to each pound of grain, of the blossom of the *Cicahia saricemera* (Bikka), is crumbled and strewed over the grain It is then pressed in baskets lined with leaves To use it, a portion of the digested mass is put into a vessel, boiling water poured over it and infused It is now the *Chona*, and it is a grateful beverage, slightly acid and not powerfully alcoholic

**CHONG**, a hill tribe on the side of the Mekong basin, but towards the sea between  $11^{\circ}$  and  $12^{\circ}$  N They preserve more of the Australo-Tamulian character than any of the neighbouring tribes Their hair instead of being stiff or harsh as in the Mongolian, Tibetan, and prevalent ultra-Indian and Malay-Polynesian race, is comparatively soft, the features are much more prominent and the beard is fuller.

**CHONGMONGO** HIND *Nepeta floeosa*

**CHONTI** HIND Amongst hindus, a tuft of hair left pushed on the top of the head It is also called Choti, also Chnda Mahomedan boys sometimes retain it, as a votive offering to some saint All mahomedan women dress their hair with the Chonti, or tui, hanging behind and largely added to by then hair that has been combed out See Choor

**CHOOA** HIND also Battoo, also Marsi, *Amarantus oleraceus*, *Elliott*

**CHOOARA** From Chooara to Sungla of Tookpa, three passes cross the top of the Himalaya range in Kunawar, Neebing 16,035 feet, Gooms, 16,026 feet, Goosool 15,851 feet, all crossing the top within half a mile of each other

**CHOOBOO**, a hybrid between the yak and the Indian cow

**CHOOKRA**, the lowest class of village servants Kummala, or Blungee, Hula khori, and Khak-roh The head of the race is called Mihtar (Persian, a prince) and his perquisites are Mihtari — *Elliott*

**CHOOIA**, a rivulet or naddy near Shah-zad bari and Hurdashpool in Bareilly runs near Nugeena in Bynoni

**CHOOKEH** HIND BENG *Rumex vesicarius*, *Sorrel*

**CHOOKO PALUNG** BENG *Rumex vesicarius*

**CHOOKUL** or **CHOPUT**, This is in general use amongst the natives in Manbhoom during wet weather

**CHOOA**, a tribe of Tuga in Baghput,

so called from having come from Chooloo or Choomo in Bikanir — *Elliott*

**CHOO LAEE** HIND This name is indifferently given to *Spinacia tetrandia*, *Tetrandra spinach*, and *Amarantus polygamus* The former is a common sort of native greens, and, when boiled, resembles spinach, it is procurable nearly all the year round The latter is much cultivated by the natives. It is sown broad-cast in beds from June to March The leaves are sold in the bazar at one piece the seer Used as greens and also in curries — *Riddell, Jaffrey*

**CHOO LI** HIND A whirlpool, also the rounded stones formed by attrition in running water, called also Rori, and Bmlung. They are used by Saiva hindus as the lingam, emblem of Siva See Bin-lung, Chuli

**CHOOMLI KOL** A branch of the Kol race, also called "Mullar" and "Panburi" This branch is respectable, and is employed in every Dekkan village as a member of the third division of the Balottah, and supplies water to travellers, wearing on his head the Choomh or twisted cloth, on which to rest the pot, hence the name

**CHOO-MO-REE-REE** This lake owes its name to a legend A goddess "Mo" is said to have haunted this lake "Choo," and while sitting over it used to call out incessantly, "Ree, Ree" thence Choo mo-ree ree It is on the lofty platform of Rnpechu, which extends from the Parang pass across the main chain of the Himalaya, to the adjacent head of the Zaskar valley The lake is 15,200 feet above the level of the sea — *Mrs Hervey's Adventures of a Lady in Tartary, Vol I, p 118 Hooker et Thomson*

**CHOO NCHA** BENG Country sorrel

**CHOO NDUREE** Once a year, on a festival day, amongst hindus, sons visit and pay adoration to their fathers The diet is chiefly of vegetables and fruits. Brahmins, with their unmarried daughters, are feasted, and receive garments called *choonduree* from their chiefs

**CHOO NEA** A Kafi tribe See Kafistan, Kushi

**CHOO NGUL** HIND, also Khoneh, a handful of anything — *Elliott*

**CHOO NJERMA** A pass in Nepaul, in Lat  $27^{\circ} 33'$ , Lon  $88^{\circ} 1'$  Crest 16,000 feet Temperature  $24^{\circ}$  at 5 p m

**CHOO N KIURKEE** BENG *Apluda aristata*

**CHOO NOKOLEE** URJA ? A tree of Ganjam and Gumsur Extreme height ten feet, circumference one foot, and height from ground to the intersection of the first branch, five feet said to be a common useless tree The fruit is eaten — *Captain Macdonald*

**CHOO FREE ALOO** HIND. *Dioscorea*

globosa Tubers roundish, very large, white inside, and much esteemed, the skin thin and smooth like a potato. The stems require strong sticks to creep over, it bears a large roundish fruit, like an oak apple in appearance, which is also edible. The words seem to be correctly *Safu-alu* — *Riddell*

CHOORA-KARANA SANS From Chooria, the bunch of hair on the crown of the head, and knee, to do. See Chouti

CHOORCHITTI HIND Paper or deed of relinquishment.

CHOOTI-ELACHI HIND *Elettaria cardamomum*. Properly Choti-Ilachi, the Lesser Cardamom

CHOOTRAPHUL A Nepaul tree, not unlike the barberry; the wood is of a strong yellow colour, but does not afford a permanent dye, the women of Nepaul use it instead of sandal for tracing the tillah on their forehead — *Smith's Nepaul*

CHOP CHIN A brand, a stamp, a seal from chap, Hindi

CHOPADA SUM *Artocarpus integrifolia*, *Linn*

CHORA GUZ *Dolichos caryocarpus*

CHORA KANTA HIND *Andropogon aciculatus*. The Spear grass

CHORAM TAM Food

CHORASMIA, or Khwarizm, the country on the east of the Caspian Sea, the capital of which was Gurganj. The Arabs converted the name of the country into Jurjan, and that of the capital to Jurjanja. The Mongol form of the name was Oigany. Nosh-tigun, a Turkish slave of Malik-shah Saljuk, was made governor of the province, and contrived to secure his independence. His son, Kutb ud din, extended his dominions, and acquired the title of Khwarizm-Shah, a name which had been borne by the rulers of the country before the mahomedan sway. This empire of the Khwarizm kings rose upon the ruins of the Saljuk dynasty, and their territories extended from Azarbaijan and the Caspian Sea to the Indus, and from the Persian Gulf to above the Sihun or Jaxartes. A

succession of nine princes reigned for 138 years, from 491 to 628 Hijra (1097 to 1230 A D), but in 618 H, the last of them, Jalal-ud din Mankburn, was driven by Changiz Khan beyond the Indus, and he was killed in Mesopotamia ten years afterwards, stripped of all his dominions

CHORAYEGODEE UPJA ? A tree of Ganjam and Gumsu. Extreme height 22 feet, circumference  $1\frac{1}{2}$  feet, and height from the ground to the intersection of the first branch, 6 feet. Used for firewood — *Capt Macdonald*

CHORBAT This district is a dependency of the government of Iskardo, which, like that of Le, is subject to Kashmir. The desert country by which Nubra and Chorbat are separated has, for the present, acted as a barrier to the further extension eastward of the mahomedan religion, which is now universally that of the people of the whole of the Iskardo (or Balti) district, as well as of Dras. On the Indus, and in the valleys south of it, there is no uninhabited tract between the two, so that the mahomedan and buddhist population are in direct contact. The result is, that mahomedanism is in that part gradually, though very slowly extending to the eastward — *Dr Thomson's Travels in Western Himalaya and Tibet*, p 204. *Tibet*. See Maynul India 317, 337

CHOR-GANGA, in A D 1131, invaded Orissa and established the Ganga vamsa dynasty, which lasted till A D 1451. See Chui-Ganga, Orissa

CHORI AJUAN DUK Seeds of *Cleome viscosa*

CHORIZEMA SPECTABILIS One of the Leguminosae, an ornamental flowering plant found on the west coast of New Holland by Labillardiere, some species have scarlet coloured flowers, others yellow and red. They grow best in a rich loamy soil, and may be raised from cuttings, as well as seeds, which they produce in abundance — *Riddell*

CHOR-KANTA BENG *Chrysopogon acicularis*, Syn of *Andropogon acicularis*. Spear-grass

CHOR-KONDA, a glacier in Balti, in Tibet, is in L 35° 36' N and L 75° 58' E, and 16,900 feet above the sea

CHOR-KULLI HIND *Soyimida febrifuga*

CHORO-CADAMBOO ? TAM A Tiavancore wood, of a yellow colour, specific gravity 0.529, used for packing cases

CHOROLI KI BHAJI DUK *Portulaca quadrifida*

CHOR-SACI, an ancient term by which the Scythians designated the ancient Persians. See Kurmsaq

CHOR PUTTA or SURAT *Urtica crenulata*, a gigantic stinging nettle, a native of

the hills and valleys on the east of Bengal, Luckipore, Pundua Hills and Assam. This nettle affords a quantity of fine white fibre of no great strength and not durable. The hill tribes fabricate it into coarse cloths — *Royle Fib Pl*

CHORUR, a river near Jom in Holen's kingdom

CHORPEN, in hinduism, a pile dedicated to the five elements. It seems to be the budhist Chod'ten, or relic receptacle

CHORUPAR, in Mewar a grant of land by the sovereign, resumable at pleasure. See *Kilnatta*

CHOSA SANS *Piper nigrum* Peppy

CHOSROES, in Persian Khosru or Kesi, Kism or Kisma two Persian kings of this name of the dynasty of the Sassanids.

Chosroes I, styled Nousherwan, A.D. 531 to 571, was defeated on the plain of Mehtene, by Justinian, the general of Tiberius Constantine. Amongst the plunder obtained was his drinking cup, of gold and paste jewels, which is now in the *Bibliothèque Impériale* of Paris. He was succeeded by Hormuzd.

Chosroes II or Khosru Parvez A.D. 591, reigned till A.D. 628, when he was put to death by Kavad. He was grandson of Chosroes I and he married a daughter of the emperor Maurice, and this body is generally supposed to be the heroine of the eastern romances Khosroo and Shirin, and Farhad and Shirin. Near Baghdad is an arch, known as the Tak-i-Kism or arch of Chosroes, which marks the site of the ancient Ctesiphon — *Mordtmann, Smith, Prinsp. by Thomas*. See *Greeks of Asia*, Kisi, Khosru Parvez, Sassanid kings, Tigris.

CHOT HIND, also Ghaonghi, a blanket, cumblu, or sheet, folded or tied at one end to form a cloak — *Littot*

CHOTA HIND *Pyrus Kumtorensis*

CHOTA HIND Small, hule

CHOTA AKUNDA HIND *Colotropis herbacea* *Corey*

CHOTA AL KI PAT DUK *Morinda umbellata* leaves

CHOTA CHAND BLG HIND *Ophioclyon serpentinum*

CHOTA CHIRAYTA HIND *Cicendia hyssopifolia* *Adenium hyssopifolium*. See *Chiretta*

CHOTA GUL KHAI RU See *Khabaji*

CHOTA JAM BLG *Eugenia caryophyllifolia*

CHOTA KALI SIND, a river near Dabla in the Indore territory

CHOTA KAROONDA DUK *Calissa spinarium*

CHOTA KOKSUN BLG *Vernonia cinerea*, *Less*

CHOTA-KANOOR DUK *Aloe litoralis*

CHOTA NAGPORE, properly Chuttia Nagpore, is the country on the eastern part of the extensive plateau of Central India, on which the Koel, the Subanrek, the Damudali and other rivers have their sources. It extends into Sirgajah and forms what is called the "Upraghat" or highland of Jaspur, and it is connected by a continuous chain of hills with the Vindhyan and Kymen ranges from which flow affluents of the Ganges, and with the highlands of Amarkantak on which are the sources of the Nerbudda. The plateau averages 2,000 to 3,000 feet above the level of the sea with an area of about 7,000 sq miles. It is on all sides difficult of access. It is a well wooded, undulating country, diversified by ranges of hills, and has a genial climate. The population in 1866, was estimated at about a million, and is formed of a number of non-Aryan tribes who had fallen back to that refuge from the plains, more than half of them being the rice known to Europeans as Kol. On the south west frontier of Bengal, besides Chota-Nagpore, are Singoojah, Palamow, Ramgarh, Hazareebagh, Mynpat and Amarkantak. The elevation of Chota Nagpore is 2,000 to 3,000 feet with hills running E and W, but of little height; Sirgojah is mountainous, rising 600 to 700 feet above the level of Chota-Nagpore. Mynpat is a table-land about 30 miles S.E. from Singoojah town, and about 3,000 or 3,500 feet high. Palamow district is very mountainous. Hazareebagh town, 24°, 85° 54', 1750 feet. Slope of the country to S towards Sambulpore N and E parts of district very mountainous, but level and even depressed towards the Mahamuddy. Sambulpore town, only 400 feet. Orissa table-land then rises on the southern side of Mahamuddy, in some places to 1,700 feet backed by the chain of E Ghats. Amarkantak, jungle table-land, 22° 40', 81° 5', 3,500 feet. The soil in the plains is generally fertile, producing abundant crops of wheat, barley, rice, pulse, excellent vegetables, cotton and sugarcane. The cultivated parts are over-run with a coarse grass.

There are 21 mehals, which form the S.W. frontier of the Bengal province, and which may be classed in four groups, the Sambulpore, Patna, and Singooja groups, and Singhboom.

Singboom

The territories comprised in the Sumbulpore and Patna groups which were ceded to the British Indian Government by the Treaty of 1830 with Ragoji Bhonsla, were all, except Raigarh, restored in 1806, and finally reverted to the British in 1826. The Sumbulpore and Patna groups are in the circle of the Cuttack Tributary Mahals. Singhbhum was never Mahratta, and in 1857 its chief, the raja of Poorhat, joined in the rebellion, many of the Lurka Kol following him. A christian mission went to Chota Nagpore, in 1845, and has made much progress amongst the Dhangri race. In Chota Nagpore, in which are the districts of Maunbhoom and Singhbhum, the mortality from the famine of 1866 fell on the population about the same as in Orissa.—*Lt Col E T Dalton Bengal As Soc Jour July 1866 Atcheson's Treaties* See Ho India, 329,330 Kol 536 Sontal

CHOTA OKRA HIND *Zapana nodiflora, Linn*

CHOTAREWULIAH, a town of Oodeypoor

CHOTA PAND-ALU DUK *Dioscora aculeata*

CHOTA SUNDHI BENG *Nymphaea eduhs, D C*

CHOTASURJOO A river near Azimgauh

CHOTIAL HIND *Rheum emodi*

CHORI BENG *Corchorus olitorius*

CHOTI SIM-KI PHALLI HIND *Dolichos lablab* Native Bean This is a smaller species of the *Dolichos lablab*, the legume and seeds are both eaten, it is sown in the rains, and sells from one pice or two a seer.—*Riddell*

CHOTI ILACHI HIND *Elettaria cardamomum, Wh and Mat*

CHOTI MAI HIND Galls of *Tamarix orientalis*

CHOTI MEGILA HIND See Jute

CHOTO PHUTIKA BENG *Osbeckia aspera, Blume*

CHOTTA of Kaghan, Pyrus *Kumaonensis*

CHOTRA HIND *Berberis aristata*

CHOU HIND Four, softened from char, four, from which are many compound words.—*Elliot*

CHOUBE A class of brahmins who originally received their names from reading the four (chou) Vedas as Doobe was derived from reading two and Tribudee from reading three, of the Vedas See Canoujee

CHOUBEEPOOR, in L 81° 52' E, and L 27° 0' N

CHOUREESA From choubees, twenty-four, is a name applied to a tract of country containing that number of villages in the occupation of a particular tribe. There are several of them scattered over the provinces,

but they may perhaps be more frequent in the neighbourhood of Muttra than elsewhere

CHOUDAPOKRY, in Long. 86° 49' E, and Lat 21° 6' N

CHOU DE BRESIL—Fr. ? *Caladium esculentum*

CHOUDHURI An overseer Commonly written Chowdri —*Elliot* See Chowan

CHOUIION, a rajput race who trace their origin from near Sambhur and Ajmir See Chohan —*Elliot*

CHOUDWA, in Long 70° 38' E, and Lat 31° 44' N

CHOUDWAN, a tract of country in the district of Dera-i-Ismael Khan See Khyber, p 514

CHOUGH, the Cornish Chough, (*Fregulus graculus*), is an inhabitant of the more elevated regions of the Himalaya, and of all high middle Asia, also stated to have been obtained in the vicinity of Calcutta.—*Cal Rev*

CHOUGHAN, in Rajpootana, then champ-de-mars

CHOUK HIND A market place, chouki a custom house, a police station, choukidar a policeman —*Elliot Wilson*

CHOUKANDI, or Luri ka kodan, so called from the leap from its top of an Ahu, by the name of Luri. It is in the town of Sarnath, and is a lofty mound of solid brick-work, surmounted with an octagonal building. Hwen Thsang describes this tower to have been no less than 300 feet in height.—*Tr of Hind, Vol I, p 295*

CHOUK MARAM TAM *Casuarina multicata, Roxb*

CHOUL, in Lat 18° 32' N, Long 72° 54' E, is five miles south of Colaba

CHOULA See Hindoo

CHOULA, also Chaura, HIND *Dolichos sinensis*, a pulse commonly cultivated in Hindoostan. It is also called Ruwas and Rumas, also, in Persian, Lobeas

CHOULAM See Hindoo

CHOULTRY, or Chattrai HIND Chawadi TEL | Chattram TAM In the Madras Presidency, a resting-place like the mahomedan sarai, a police-station, a post house

CHOUNDESWARI See Hindoo

CHOU-MURTI MAHADEVA A name of the four-faced lingam, one of which is in one of the Ellora caves, others in the Burabur caves, and many in the Gyrh district. The meaning is, as an ordinary lingam can be worshipped only looking in one direction, this four faced one can be looked to from four sides. See Burabur

CHOUMASA HIND The Indian seasons are, according to the Shasters, six in number,

each comprising two months. These divisions are more fanciful than real, and the common people are content to adopt the more definite division of three. Choumasa, or Buik'ha, constitutes the four months of the rainy season. The rest of the year is comprised in Seeula, Jua, or Mohasa, the cold season, and Dhoobkala, or K' hursa, the hot season — *Elliot*

**CHOURA-DADUR**, a plateau in Central India, which has an area of about 1000 square miles. It is covered with jungle.

**CHOURAGAD**, the highest summit of the Mahadeva Hills, has an altitude of 4,200 feet above the sea, the usual height of the range, which entering the Nagpur territory from Gawilghur, passes by Dewaghat towards Shiwan, is not above 2,000 feet, though in the east of the same chain, where it goes under the name of the Luni Hills, some of the peaks attain an elevation of 2,300 and two 2,400 feet. At Nagpur the country has fallen to a level of 1,000 feet. On the west, however, it immediately rises by 200 or 300 feet in a succession of eminences — *Carter's Geological Papers on Western India* p 248

**CHOURASEE HINN** Literally, eighty-four, is a revenue term applied to a subdivision of a pargannah, or district, amounting to 84 villages. Tod, in his "Annals of Rajpootana," where chourasees are numerous, remarks that they are tantamount to the Saxon Hundreds (*Vol I, p 141*). The Chourasi, eighty-four [townships] of Ruttangurh Kheji, was in S 1828 (A D 1772) assigned to Madry Sindia to pay off a war contribution, and until S 1832, its revenues were regularly accounted for. It was then made over to Berji Tap — *Tod's Rajasthan, Vol II, p 637*

**CHOUREEONA ULIA** ? A tree of Ganjam and Gumsur, extreme height 30 feet, circumference 3 feet, height from the ground to the intersection of the first branch 8 feet. Tolerably common and burnt for firewood. The bark is used medicinally for rheumatism. The flowers are worn — *Captain Macdonald*

**CHOUSUTH SUTOON**, or Chousut Khumbh. Sixty-four pillars. See Chounsut Khumbh.

**CHOUTAL** MALAYALA. A Canara tree that grows to about forty feet in height, and eighteen inches in diameter. Its wood is used by the native coopers in preference to other woods of the country for casks, vats, tubs, &c — *Edye, M and C*

**CHOUTH HIND**. A fourth part, implying the fourth part of the revenue, which was the war-tax imposed by the Mahrattas on all the countries that they conquered.

**CHOUTUNG**. A river near Futtelipool in Umballa district.

**CHOVANNA MANDARI** MALLAL. *Bauhinia variegata B purpurea*

**CHOW**. In China, a district. A "Chow" is similar to a Ting, as also a Heen, but each is a smaller division, each Fu, Ting, Chow, or Heen has one or more towns, or walled cities under its guidance, one of which takes its name and rank as "Kwang-Chow-Fu" and "Shang-Hae-Ileen," which latter, although of that subordinate rank, is the largest maritime city in the empire, and the greatest resort of the native ships or junks — *Forbes' Five Years in China, p 10-11. Sin, Vol I, p 211 223*

**CHOWAT KURNAT**. This fibrous material, from the Baram river, is supposed to be from a species of *Artocarpus*, its bark and bark cloth were sent to the Exhibition of 1851 — *Royle Fib 1<sup>st</sup>, page 341*

**CHOW CHOW CHIN**, Mixed preserves. **CHOW CHOW**, or Nine Islands, in the Canton river, about four miles north east of Miao, are a group which lie contiguous to each other.

**CHOWDRI**. A head of a division, or sect, or gang. In many hindu cities, the different classes of the community of every rank still acknowledge certain of their members, as their hereditary headmen or priests. These are the Sartavah of the brahmins, and Sudai of the mahomedans. The Chowdri is usually a woman overseer — *Wilson Hind Th*. See Choudhri.

**CHOWGHAT**. A district in S Malabar. **CHOWHATTIA**. A head of a tribe of the Miana race. The Miana of Malha in Mucha Kanta, or the banks of the Muchu river, are the real masters of Mulha. They have a Thakur, but own allegiance only to their own Chowhattia. The Miana are turbulent, take service in the neighbourhood, and in every boundary fight a Miana or two are killed.

**CHOWLI DUK**. *Portulaca quadrifida*. **CHOWNREE**. A swish or fly flapper made of horse hair, the hair of the tail of the Yak of Tibet, or the fine shavings of sandalwood, and used by domestics and horsekeepers to brush flies away. They are sometimes made of the stems of sweet smelling grass — *Herbotts*. See Chowli.

**CHOWNSUT KHUMBH**, or Chounsut Sutoon, as it is commonly called, is quite close to the tomb of Nizam ood deen Aoleea, near Delhi, and is a singular structure. As the name implies, it is composed of 64 pillars. They are of white marble, supporting a square roof of the same material, which occupies a tolerably wide area. It is a building of great purity, its pale aspect of white throughout being interrupted by no other color. The lattice work that surrounds it is of very deli-

cate execution and well polished This building seems to be erected to the memory, if not actually over the remains, of a celebrated poet and historian, Ameer Khoosloo, a native of Samarcand and a prince He was a contemporary and friend of Sheikh Nizam-ooddeen Aulea, not far from whose tomb this building is raised — *French's Town*, page 13

**CHOWR**, Chamaia, or Chawii, **HIND** A kind of whisk, made sometimes of peacock's feathers, sometimes from the tail of the yak, sometimes of the shavings of sandal-wood, of horse hair or of glass, and used for the purpose of driving away flies, musquitoes, and other insects They are usually seen in the hands of the attendants of the gods The chamari or chowii from the white bushy tail of the Thibet cow, was, in ancient India, fixed on a gold or ornamental shaft, between the ears of the horse like the plume of the war-horse of chivalry, the banner or banneret, with the device of the chief, rose at the back of the ear, sometimes several little triangular flags were mounted on its sides "The waving chowii on the steed's broad brow points backwards motionless as a picture" — *Coleman*, p 376. *Hindu Theatre*, Vol 1, p. 199

**CHOWRA** A dynasty that ruled at Anhilpura in Guzerat from A D 746 to 942, when they were dispossessed by Mul Raj, a Solunkhi rajput The Chowra dynasty is usually known as the Saura, the natives of the S W of India change s into ch

**CHOWRI TEL** (Chavadi) a caravanserai — *Wilson*

**CHOWRY**, one of the Nicobar Islands

**CHOY-ROOT** Chayroot

**CHOW-YU CHIN** Dioscorea batatas

**CHOZAN TARIARS** These were Israelites professing the Jewish religion and practising circumcision

**CHRAN-KOTTA MALEAL** Semecarpus macardium

**CHRI KUTAJA SANS** Connessi bark

**CHRIST**, from the Greek word christos, equivalent to the Hebrew and Arabic 'Massiha,' from Mas'h, anointed The Christ is Jesus of Nazareth, called Jesus and Jesus Christ, also the Messiah The mahomedans designate him Isa Masiha, Jesus the anointed, also designate him Ruh ullah, the spirit of God, as Moses is known as the Kalan ullah, the Speaker with God, and Abraham as the Khalil ullah, or Friend of God

**CHRISTIANS** in British India, are in many sects, and of many races, but there have been converts to this creed since the earliest days of the christian era Arabia seems to have early adopted the christian faith The Eastern Churches believe that St Thomas preached in

Arabia Felix and Socotia on his way to India, where he suffered martyrdom, about A D 50, and it is said that the rudiments of the religion of the cross were first implanted amongst the Timyarites, by St Bartholomew It is also recorded that St Pautenus was sent by Demetrius, Bishop of Alexandria, to preach in Arabia Felix, and there he found traces of St Bartholomew, amongst others, a copy of St Matthew's Gospel written in the Hebrew character, which he brought away with him to Alexandria In the reign of Tobba, son of Hassan, from A D 297 to A D 320, Christianity became more generally known in Arabia, and extended to Abyssinia, where the people, though surrounded by Mahomedan and Pagan tribes, continue Christians till the present day Subsequently, in A D 326, Frumentius was elected by Athanasius, Bishop of the Indians, where he contributed much to the propagation of the christian religion, but whether Arabia or Abyssinia was the scene of his labours, is disputed In A D 342, Theophilus Indus, a native of Diu, obtained permission to build churches in Yemen, one of which was erected in Aden — (*Playfair*) St Thomas and Bartholomew are said in tradition to have preached in the East St Thomas in India, where he is believed to have become a martyr near Madras, at the Little Mount, half way between St Thomé or Mylapoor and St Thomas' Mount Cosmas Indicopleustes, who travelled in India A D , and afterwards became a monk, mentions the presence of christians

Alfred the Great, in A D 883, sent Sigheilm as an ambassador to the christians at Mylapur (*James A St John History of the Four Conquests of England*)

The estimated numbers of christians in India in 1868, is a million and a quarter In China about 800,000

	Europeans and Americans	Mixed	Natives
The Army	58,000		
Municipal Calcutta	12,000	11,036	
Suburbs, do	8,000	1,000	
Bombay City	8,415	1,891

Total	1,47,585	40,789	

The Roman Catholic christians are esti-

mated to amount to 936,419, over whom are 814 priests, and 18 Vicar Apostolics. There are 414,096 christians in the south of the peninsula. In Travancore, in the London Mission, 22,688, Church Mission 6,549, Romanists, 230,000. Many of the Guro and Khassya have been won over. The Gonds in Central India have become moved by christian missionaries. Of the Kol, 12,000 have become christians, and the four millions of aboriginal tribes are supposed by Colonel Dalton to be likely to be moved in a few generations. These were in 1867, in the Tenasserim, Martaban and Pegu Provinces, about 17,000 native communicants, chiefly Karen. Further east in China, a great political and religious movement occurred about the middle of the nineteenth century, in which many Chinese adopted a belief in the Lord of Heaven. In British India, amongst the hindoo races, the educational efforts of the British Indian Government were on the largest scale, but christianity has not, hitherto, much benefited by them. Their over education has unspiritualized the educational efforts of missionaries, and created a desire for mere worldly advancement, which has killed in some hopeful cases the inner life. Throughout the south and east of Asia, there may not, in the latter third of the nineteenth century, be four millions of christians, amongst about six hundred millions of buddhist hindus, mahomedans and shamanists. And these three millions are of every race and scattered in small parties.

CHRISTIE, Dr Turnbull, of the Madras Medical Service, who gave the first account of porcelain clay at Mangalore, in *Bl As Trans*, 1841, vol X part 2, 967. Also wrote on the Mineralogy and Geology of the Southern Mahratta Country, *Mad Lit Trans* vol IV 135, 452, which was reprinted from *Edin Phil*, JI. Instructions for meteorologists, *Observations on and plan for, new instruments* Ibid, vol II 41 70. *Observations on the Geology of the Hyderabad country* Ibid, 1827, 79. See *Memoir of*, in *Edin Phil* JI vol. XV 165 and *Biographical notice of*, in *Mad Lit Trans* vol XV 150.—*Dr Buist's Catalogue*

CHRISTIE, Colonel John, a distinguished soldier of the Bengal Army, who gave his name to Christie's horse. He entered the service in 1823, attained the rank of Colonel in 1854, in 1856 was appointed Aide Camp to the Queen, in 1857 and 1858 he commanded the Dinapore Division of the Army of Bengal, and afterwards the Brigades at Barrackpore and Berhampore. Few officers have seen more continuous service in the field. In 1826, he served at the

seige and capture of Bhurtpore, for which he received a medal. He served under Lord Keane and General Nott in the two Afghan campaigns, in the command of the 1st Cavalry of Shah Shooja's horse, which he himself had raised. He was present at the occupation of Larkhana, Candahar, and pursuit of the sirdars of Candahar. He was present also at the storm and capture of Ghuzni and the capture of Kabul in 1839, and received a medal and the 3rd class Durand Order, and in 1840, accompanied Major Outram in pursuit of Dost Mahomed Khan across the Hindu Kush to Bamean. He subsequently served with the Candahar Force under General Nott, and commanded the Cavalry on the 28th August 1842, when the enemy was repulsed in an attack on the Rear Guard at Karez-i-Osman Khin. He was present also in the action at Gwame, when he captured one of the enemy's guns, and was an actor in all the subsequent operations leading to the reoccupation of Ghuzni and Kabul, the storm and capture of Istalif, for which he received a medal, and in the retirement from Afghanistan through the Khoad, Kabul and Kybur passes. He was present also in the Gwalior campaign, and at the battle of Punna, for which he received a Bronze Star. He served, also, with the Army of the Sutlej, and was present at the actions of Mudki, Ferozshah and Sabaoon, for which he received a medal, two clasps, and promotion to the rank of Brevet Major. He subsequently served throughout the Punjab campaign, including the passage of the Chenab, the battles of Chillianwala and Guzerat, and joined in the pursuit of the Sikhs and Afghans by the force under Major General Sir Walter Gilbert, receiving a medal, clasp and the rank of lieutenant colonel. It was thus seen that he had a continuous field service of 21 years, during which he commanded a regiment of cavalry in four campaigns for a period of 17 years, embracing an era, wherein took place the most important military events recorded in Indian history. In the amount of service and the efficient and creditable performance of his duty, he was not surpassed by any soldier of the day. He was unrivalled in his tact and management of the native cavalry under his command, and no regiment of cavalry, regular or irregular, excelled his soldiers in discipline, and by few was it equalled. As the crowning triumphs of this soldier, distinguished through a long career, by his power to control and bend to his views the various races who serve in our ranks in the Empire of India, when, in 1859, discontent and the mutinous spirit occurred among the European soldiery, Colonel Christie was em-

ployed to bring them in order at Berham-  
poie

**CHRISTMAS FLOWER** ENG *Chrysanthemum indicum* The common Gool Di-  
wadee, of which several varieties grow all  
over India

**CHRISTMAS ISLAND**, South of Java,  
is of a square form, about nine miles each  
way The body of the island is in Lat 10°  
34' South, Long 105° 33' East

**CHROME IRON ORE**, or chromate of  
iron, is a compound of oxide of chrome with  
protoxide of iron It is met with massive, and  
in octahedral crystals of a blackish colour,  
and imperfect metallic lustre It is found  
in Unst in Shetland, France, Baltimore in  
America, and the Salem district in the Madras  
Presidency At the Madras Exhibition of 1855,  
a very fine sample of chrome ore weighing  
about 5 cwt was exhibited by Mr Fisher of  
Salem The ore has been so largely exported  
to England as to have lowered the commercial  
value of the mineral Very good samples  
were also exhibited at the Madras Exhibition  
of 1859, from Salem, Vizianagram and  
Bangalore, but as yet nothing has been done  
in India, to turn this mineral to useful ac-  
count on a large scale from the want of  
proper appliances The consumption of this  
substance in Europe is in the manufacture  
of bichromate of potash for dyes, the chrome  
ates of lead for painting, and chromic acid for  
coloring pottery, porcelain and glass The  
supply of Chrome Ore in Salem is said to be  
abundant, but the raw material will not pay  
expense of freight The chrome ores used in  
England are obtained from the Shetland island  
and Styria where they are abundant, and as  
the quantity required for manufacturing pur-  
poses is not large, the raw ores of India could  
never be brought into the English market  
so as to prove remunerative — *M E J R*

	Æra of Constantinople, begins Civil 1st Sept, Ecclesiastical 21st March	5508

*For Epochs after Christ*  
Year of Christ complete, according to Diony-  
sius Exiguus

0

The only cycle in use among the Tur-  
anian races, in old India and Thibet, was  
that of 60 years, and in the form 12 × 5  
In the Chaldee chronology, a cycle of  
60 × 10 years was employed (10 Sossu be-  
ing equivalent to one Siro,.) and Josephus  
styled the Epoch of 600 years which grew  
out of it, the great patriarchal year The  
earliest Chinese chronology rests upon a con-  
ventional basis peculiar to itself, that of li-  
mitting the lunar year of a cycle of 600 years  
which is common to the whole of Northern  
Asia and the Chaldeans and probably (as it  
is also met with in India) to the Bactrians  
also this basis is historical The commu-  
nication took place before the Chaldees in-  
vented the cycle of 600 years The Chinese  
observation is based upon the use of the  
Babylonian (*Bunsen*) The beginning and  
end of the day has varied Among the Greeks  
and Etruscans the day began at noon, among  
the Romans as with British at midnight,  
among the Persians at sunrise, but among the  
Jews and Egyptians, as now with Hindus,  
mahomedans and parsces it began at sunset  
— *Sharpe's History of Egypt, Vol I, p 58*  
*Captain Edward Warren's kala Sankahlita*

*Bunsen's Egypt Servus in Aeneid, V. 738*  
*Genesis Chapter I*

CHRYSANTHEMUM a genus of plants belonging to the natural order *Compositæ* and the sub-order *Corymbiferae* or *Asteraceæ*. The species are very numerous in the temperate parts of the earth—*Eng Cyc* page 1058

CHRYSANTHEMUM PERUVIANUM turns continually towards the sun. As a general rule, however, all plants turn towards the sun. *Hypochaeris radicata* and *Apargia autumnalis* are seen in meadows turning towards the sun, and species of *Melampyrum* and *Narcissus* turn similarly—*Winslow on Light*

CHRYSANTHEMUM ROXBURGHII DESF

Christmas flower,	ENG	Chamanti,	TEL
Gul Dawadi,	HIND	Bagaur of	CHENAB
Gendi,	"	Kalzang of	LADAK

The name is from two Greek words, chry-sos gold, and anthos, flower. The plants commence flowering generally in November, and continue for several months. The colours are mostly yellow, orange, and a purplish colour mixed with white. The beautiful yellow fragrant flowers of this plant, are made into garlands, and offered at the shrines of Vishnoo and Siva. If grown in pots they require a good rich soil, to which pounded bricks should be added, and a little lime to preserve the foliage from mildew, to which they are subject. They are commonly cultivated in gardens in the plains of India, in Kashmeer, Upper Chenab to 9,200 feet, and in Ladak at 11,300 feet. Masson mentions a chrysanthemum at Kabul—*Ainslie Dr J L Stewart*. See Flowers

CHRYSANTHEMUM SINENSE is extensively cultivated in European gardens and is the Chinese gardener's favourite winter flower, although it is generally past its full beauty at the Chinese new year. There is no other plant which he takes so much pains with or which he cultivates so well. His camellias, azaleas, and roses are well grown and well bloomed, but in all these, the people of Britain excel him. In the cultivation of the chrysanthemum, however, he stands unrivalled. In China, as in England, the chrysanthemum flowers during the winter months. When in bloom, it is in great request among the people, and is used in the decoration of court-yards, halls, and temples. It is every body's plant, and blooms alike in the garden of the lowly Chinese cottager as in that of the red-button-

ed mandarin—*Eng Cyc* page 1052.  
*Fortune's Tea Districts, p 125*

CHRYSE. "The gold-land" of the *Periplus* is apparently Pegu and thereabouts, the *Suvarna Bhumi* or Golden Land of the old Indian buddhists. *Sonaparanta*, a term of like meaning, is still the sacred or classical term for the central territories of *Avā*. *Periplus of the Erythræansea Yule Cathay, I, p cxiv*

CHRYSOBALANUS ICACO ROSACEÆ. This the cocoa-palm tree of the West Indies, has been lately introduced into India.

CHRYSOBERYL See Beryl C Oorundum. Gem

CHRYSOLITE See Gem

CHRYSOMITRIS SPINUS *Carduelis spinus* 'Siskin' of Europe, Siberia, Japan, is a winter visitant chiefly in Britain, breeding in the far north.

CARYSOPHYLLUM ACUMINATUM.

Hali mara	CAN	Tursee phul	MAHR,
Star apple	ENG	Tarsee,	"
Pita kala	HIND		

This tree, one of the *Sapotaceæ*, grows to a large size, thirty feet or more. In *Canara* and *Sunda*, it is very common in the jungles near the ghats above, particularly to the south, and reaches a great height. Dr Gibson heard of it as existing in some of the ghat jungles of the Southern *Konkan*, but had never seen it except in the Upper *Canara* and *Sunda* forests where it is rather common. There are some trees in the Residency garden at *Hyderabad*. The wood seems straight and good, but the tree is chiefly noticeable from the gutta-percha-like incrustation common on the fruit. Fruit about the size of a large crab-apple, ripens in October and is edible—*Dr. Gibson, Dr Riddell*

CHRYSOPHYLLUM ROXBURGHII, G. Don

Abundant in barren land, troublesome to the feet of those who walk among it, eaten by cattle when other grass is not to be had. The common names of this variety are "lampa" and "choia-kanta". A longer variety, known solely as "soorwul" is an excellent grass for cattle. C acicularis is the

most common grass on the Tenasserim coast, its seeds stick in the stockings and produce a disagreeable itching — *Mason Genl Med Top p 176*

**CHRYSOPTILUS** Green wood-peckers See *Piedæ*

**CHRYSORRHŒA**, or "Golden Stream" of the ancient geographers, is the Barada river of Damascus, which, as soon as it issues from the cleft in the mountains, is immediately divided into three smaller courses. The largest, which is the middle one, runs directly to the city, and is there distributed to the different public fountains, baths, and cisterns, whilst the other two branching off right and left, contribute mainly to the luxuriant vegetation which adorns the environs. South-east of the city then scattered waters unite again into one channel, and after flowing towards the eastern hills for two or three hours, are finally lost in a marsh which, from one side view, appears like a small lake. Well may Damascus be called El Sham-i-Shereef, the noble and beautiful" — *Robinson's Travels, Vol II, p 115*

**CHU**, or Chu ma, or Tchou-ma **CHIN** *Boehmeria nivea* China-giass

**CHU**. **HIND** *Euphorbia royleana*, Gangi-Chu, is a species of *Euphorbia*

CHEKIANG, or Pearl River, dis-embogues after a course of 500 miles in length. As it passes Canton, it divides into two branches, which, embracing the island of Honan and the Flat islands, reunite below the Flat islands to form the true Pearl river, which flows on in a broad stream, receives many tributaries, and finally empties itself by many mouths into the sea, below the Bogue Forts. It drains 150,000 square miles. The channels are narrow, but most of them are navigable by boats to all the large towns in the provinces of Kwang tung and Kiangsi.

CHUKKALI CHETTU *Epiparpurus spinosa* R

CHUKKAR, a Sikh weapon, resembling a quoit in size and shape, thrown from the finger with a rotatory motion—*Heiklots*

CHUKMAK Guz Hind Flints, properly *chamq*

CHUKMA, a race occupying the Toona, Joom mahals, a forest tract in the hills of the Chittagong district, along with Mug, Reang and Tipperah races, all more or less nomadic. Some one of these races till lately performed human sacrifices annually, and in the year 1852, several were tried for murder by sacrificing. The place of sacrifice was a cleared district in the jungle and staked round with bamboos about six feet high. The sacrificial pole was a "Phula baus," bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. During the celebration of these sacrifices at Agutollah, a gun is fired every evening at sunset, when every person hurries to his home.

CHUKRI HIND *Rheum emodi*, also R *palmatum*

CHUKRI See Kabul

CHUKOTARA HIND DUK, *Citrus decumana*

CHUKRA SANS A round weapon, from *chak*, to return a blow, to rebound

CHUKUDDI PATTA TEL *Cassia absus*, Linn

CHULA HIND *Euphorbia Royleana*

CHULA, a fire grate, made of mud or bricks a fireplace, a hearth, and equivalent to the "hearth" of the English, as a home A na-

tive of India wishing to express his poverty would say there was no fire in the hearth or to indicate the number of his divided family would observe that three fireplaces are burning

CHULA or Chulah Hind A tribe of Taga in Baghat

CHULAI HIND *Spinacia tetrandra*, also *Amuratus polygamus*, Linn

CHULAS There are intermixed races in the Bunn valley and may be noticed the Durdu in Giljet and Chulas

CHULCHILHERA, a lichen of the Himalaya, the *Boriera ashnehi* of Royle, with ammonia it gives a reddish brown colouring matter, and is used accordingly as a dye stuff. Dr O'Shaughnessy examined this and several other Indian lichens, but without success in the production of any valuable colour—*O'Shaughnessy*, page 672

CHULI A whirlpool in the stream of the Chumbul near Berolli, the whirlpools and eddies have given a sacred character to it, like the Nerbudda, at the whirlpools of the great god *Chuli Maheswar*. A multitude of round stones are taken out of these vortices, when they have been rounded by attrition into a perfectly orbicular form, are consecrated, and smeared with red lead, and are then called Bhyru, the god of war, the eldest son of Siva. Those of the round stones of the Nerbudda whirlpools are called Ban-Lang or whirlpool lingam, and "Roi" at the temple of Berolli. See *Binlang Tod's Travels*

CHULI HIND *Prunus Aimeniaca*, also *Pinnus padus*, also *Purslane*

CHULI, BENG HIND *Villaisia Indica*, Vent

CHULA A name given to mahomedans in Malabar—*Wilson*

CHULIA, amongst the Malays, a native of Western India. The Chulia and Kling comprehend the traders and settlers, both mahomedans and hindus, from the Coromandel coast. These names have been given to them by the Malays from the earliest times of the ancient commercial intercourse subsisting between this part of Asia and India. Kling is a corruption from Teling or Telinga, Chulia may be derived from the ancient Chola kingdom of the peninsula—*Newbold's British Settlements*, Vol I p. 8

CHULU HIND of Himalaya, *Armenaea vulgaris*, Lam; the Apricot

CHUM HIND *Euphorbia Royleana*, also *Morus serrata*, also, *Fraxinus xanthoxylloides*

CHUMANG, a low or outcast race in the non-Bhot districts of Knnawai, with dark skins. The people of the lower hills call

them Koli, and the Rampur people, Chumar. They till the soil and weave.

**CHUMAR** A scattered race in India. They are said on the authority of the Padma, Varaha, and Brahmavairatta Puranas, to be descended from a mullah or boatman, and a Chundal woman. The Chumar race is generally said to be subdivided into seven classes: Jatooa Kaeen, Kooril, Jyswara, Jhoosea, Azimgurhea, or Birherea, and Koree or Korchumia. These seven do not eat together nor intermarry. The Jatooa are chief in the North West. The Delhi Territory, Rohilkund, and the Upper, and part of Central Doab are their seats. The Kaeen are in Bundelkund and Saugor. The Kooril occupy the greater part of the Central and Lower Doab. The Jyswara meet them in the neighbourhood of Allahabad, and extend through Jounpore, Mirzapoor and Benares, to the neighbourhood of Sydpore Bhitree, where they are met by the Jhoosea, who occupy Ghazeepore and Behar. The Azimgurhea have their seats in Azimgurh and Goruckpore, and the Koree or Korchumia in Oudh. The last are generally engaged in the occupation of weaving.

Other names are mentioned besides these seven as the Jatote of Rohilkund, the Ahurwar, Sukurwar and Dohur, of Central Doab, but as these latter avow some connection with the Kooril, they may perhaps be included in that tribe. In Behar we meet also with sub-divisions of Guireya, Magahi, Dukshimia, Canoujia as well as the Jhoosea and Jyswara abovementioned, all tending to show that the division into seven clans is imaginary.

The Dohur are mentioned in "Steele's Summary," p 128, as existing in the Decan along with Kutnee (cobblers) and Duphurs (Dubgai maker of oil bottles), but he does not include them amongst Chumars, of whom he enumerates the following classes,—Sultunger, Marat'he, Paradosh, Purdesee, Huralbhutel, Dubalee, Woje, Chour.

Chumars are reputed to be a dark race, and a fair Chumar is said to be as rare an object as a black Brahmin.

Kurea Brahmin gor Chumar  
In ke sat'h nu ootriye par

That is, go not in the same boat with a black Brahmin or a white Chumar, both objects being considered of evil omen. Many of the Chumar of Central India have joined the reformed Sat-nami sect. The Chumar of Hindustan, in respect to members and avocations are in the same position as the pariahs of the south of the peninsula.—*Elliot*.

**CHUMARA** See Chaldeo.

**CHUMAYAN**, a class of Gujars, occupying twelve villages in Pamput Bangur.—*Elliot*

**CHUMBA** HIND *Artemisia sacrorum*

**CHUMBA** See Chamba. Kohistan

**CHUMBA-GUDDEE**, a race who dwell in the Chumba hills, in the Himalaya. They say they are Rajputs and of the guddee-jat. They are somewhat short, but strong and cleanly in their habits. They are sharp and able to impose on their less knowing neighbours. Most of the witch finders are of the Chumba guddee race, and the race may always be known by their peculiar conical caps with lappets to turn down over their ears like an English travelling cap. When Europeans made their first appearance in the Kangra valley, these men had very slight notions of caste, and would eat or drink anything the Europeans gave them, but since their contact with the natives of the plains they have become as bigoted as any Hindu.

**CHUMBARA** MAR *Piemna tomentosa*

**CHUMBI SAG** HIND *Amarantus polygamus*

**CHUMBO** PORT Lead

**CHUMBRAMBAUKAM**, a great tank about forty miles west of Madras.

**CHUMBRANUK** A single valve of the muscle shell without the mollusc, used in Ajmere as an aphrodisiac.—*Gen Med. Top*, p 132

**CHUMBUL**, a river tributary to the Jumna. It rises in Malwah in lat  $22^{\circ} 26'$ , and lon  $75^{\circ} 45'$ , eight or nine miles S W from Mhow, which is 2,019 feet above the sea. It rises on the cluster called Janapava. It runs North, 105 m, N W, 6 m, S E, 10 m, N E, 23 m, S W 25 m, North to junction with Kallee Sind, N E, 145 m, S E 78 m to Jumna. length, 570 m, described in a form nearly semi circular, the diameter being only 30 m. It receives the Chumbela 70, Seepira, 120, Parbutty, 220, Kallee Sunde, 225, Banas, 320, Chota Kallee Sunde, 104 m. About 56,000 square miles drained. It does not appear to be used for navigation, which is probably incompatible with the average declivity of its bed (2 feet 5 in per mile), and still more so with the general rugged and rocky character of its channel. Its average volume of water is so considerable, that at its junction it has been known to raise the united stream seven or eight feet in 12 hours. The nominal source of the Chumbul is in a part of the Vindhya range, nine miles south-west of the cantonment of Mhow, but this part of the river is dry in the hot season, during which it owes its waters to other tributary

streams The current of this river is in most parts gentle, its bed rocky, and its course through Malwa much obstructed by shallows, but, after entering Harrowtee by an opening in the Mokundia range, it becomes a fine and deep stream

The course of the Chumbul, not reckoning the minor sinuities, is upwards of five hundred miles, and along its banks specimens of nearly every race now existing in India may be found Sondi, Chunderawut, Seesodia, Ilara, Gore, Jadoon, Sikerwal, Goojur, Jat Tuar, Chohan, Bhadoria, Kutchwaha, Sengar, Boondela, each in associations of various magnitudes from the substantive state to the little republic communes between the Chumbul and Cohari The Chumbul runs through the territories of Sindiah and Holcar viz, Gwahor and Indore, and runs near Kotah — *Tod's Rajasthan, Vol. I. p 16 Rep Royal Com*

CHUMDUNKIARI, a town in Maubhom

CHUMDUL HIND, or CHAMDUI HIND Sultani album, *Linn*

CHUMERERI A lake in Ladak See Choomooriri

CHUMGA A Kafir tribe See Kafiristan, Kush

CHUM GUDHUL HIND One of the Chiroptera, the flying-fox of Europeans in India

CHUMIAH A race to the north and east of Chittagong, dwelling between the Kuki and the plains The Chumiah and the Kuki are described as having flat noses, small eyes, and broad round faces, and to differ from the Naga race both in appearance and customs

CHUMLA A valley near the Bunair or Bunnoor country in Affghanistan The valley and the central plain of the Eusufzu are commanded by hills that descend from the Hindoo Coosh

CHUMPA, properly Champa or Champala, the Michelia champaka, *Linn* The flower of the Champa is one of the five with which Kama, the hindoo god of love, tips the arrows he uses See Kama

CHUMPA NUTIA, (Varval) BRNG *Amarantus polygamus*

CHUMPOUTE The berry of a small plant, brought to Ajmeer via Pali, used in perfumes and also in medicine one seer is sold for one rupee — *Gen Med Top, p 131*

CHUMURTI A Chinese district bordering on Ladak

CHUMWA A tribe in Assam, exempt from manual labour — *Wilson*.

CHUNA BENG Cicer arietinum *Linn* Gram Through the Italian Cece and the French Chickel, comes its English name

"chick-pea" The term "arietinum" is derived from the resemblance of the seed to a ram's head The word used by Europeans in India is gram, or Bengal gram, of which the origin has been much disputed and is, it is believed, quite unknown — *Elliot*

#### CHUNAM ANGLO-TAMIL

Chunna	GUZ HIND	Sunamu	TEL
Chunnam	"	Choonuoo	"
Chunambu	TAM		

In oriental arts, a term applied to quicklime, made from nodular limestone, from limestone rocks, from marbles, and from calcined shells, also applied to plaster The plaster of Madras has long been famed for its marble like polish, and is prepared either from shells or lime stones The shells generally used at Madras are both recent and fossil, but the latter of recent species, found in extensive beds, a few feet below the surface on the banks of the Pulicat Lake, and other low marshy places on the sea coast, which are covered by the sea at high-water The shells are calcined with charcoal, one parah of charcoal being allowed to every two parahs of chunnam The kilns generally used are calculated to hold altogether 60 parahs, that is 40 of shells and 20 of charcoal A small arch, 1 foot 3 inches in height, the same in breadth, and raised 5 feet above the surface of the ground, runs longitudinally through the kiln, the top of this arch is a grating of brick on edge, which is partially covered with broken tiles, so that neither the shells nor charcoal can drop through them, but small apertures are left for the escape of the ashes and for the necessary circulation of air Over this bed a layer of charcoal is first placed throughout, about 3 inches in thickness, and fire applied when sufficiently kindled, the mixed shells and charcoal are laid in small heaps of not more than  $\frac{1}{3}$  of a parah each at about 1 foot 6 inches apart, and when the fire has been communicated to them, the intermediate spaces must be filled up with more shells and charcoal to a level, and when the fire has thoroughly extended to them also, another row is to be laid in a heap upon this mass as was done in the first instance, and in the subsequent operations are to be repeated in the same manner until the kiln is filled. The transverse arches are to promote the requisite current of air, and the windward ones are invariably to be kept open, whilst those on the opposite side must be closed The kilns used at Madras are built of brick or clay, and require renewal every three years The shells will be sufficiently calcined in 12 hours, and 24 more are required to cool them, so as to admit of their being moved and the charcoal sifted from them It is found that

chunam thus prepared and slaked to a powder is increased to double its original bulk when in the form of shells. The following is the method of plastering with chunam at Madras. If for *one coat*, the plaster is composed of one part of chunam and one and a half of river sand thoroughly mixed and well beaten up with water. This operation is usually performed by women, who stand round a small stone trough prepared for the purpose, into which the ingredients are thrown and gradually moistened with water, as the process of mixing proceeds. The women use wooden sticks shod like a rice pounder. The plaster, when mixed, is taken out of the troughs and made into conical heaps, where it remains till required, and may be kept without injury for several months, but when left for any time, a small cistern or hollow is made at the top of the heap into which water is occasionally poured. Before applying the plaster the wall is trimmed with a trowel and swept perfectly clean and then slightly sprinkled with water. The wall being ready, the plaster is put into small wooden boxes at convenient places among the bricklayers, by whom it is mixed up with jaggery water,  $\frac{3}{4}$  lb of jaggery or coarse sugar being allowed to every parah of quick lime, until it is brought to the required consistency. It is then laid on with a trowel above half an inch thick, and levelled with a flat wooden rule, being afterwards smoothed with a wooden rubber till it requires an even surface. During the process of rubbing, the plaster is occasionally sprinkled with a little pure white lime mixed with water to give it a hard surface. If for *two coats* of chunam, the first coat is applied, as already described, with the exception that the surface is left rough and no pure lime is applied during the process of rubbing. A day or two after the first coat is applied and while moist, the second is laid on. The plaster used for the second coat consists of three parts of lime and one of white sand. These are mixed as before, and afterwards ground by women on a flat stone with a small stone roller till they are reduced to a fine paste. This is laid on a wooden rubber and applied with care over the first coat about  $\frac{1}{2}$  of an inch thick. It is then rubbed down perfectly smooth with a small trowel, and afterwards polished with a crystal or smooth stone rubber, and as soon as it has acquired a fine polish, a little very fine potstone (Ballapum) powder is sprinkled on it to increase the whiteness and polish, and the polishing continued. The second coat ought to be applied and finished in one day, for it usually hardens too much during the night to be polished the following day, except in damp weather. The practice is to con-

tinue polishing the plaster until it is quite dry, and a number of bricklayers are employed in order that it may be well polished the first day. Moisture continues to exude from the plaster for some days after it is completed. This must be carefully wiped off with a soft cloth, and the wall kept perfectly dry till the moisture entirely ceases. For *three coats* of chunam the first coat is as above, but it is left a fortnight or three weeks to dry before the second coat is applied. The plaster for the second coat consists of one part of lime and one of fine river sand freed from the coarser particles and clay by sifting. It is well mixed and beaten up in a clean trough, and applied over the first coat about  $\frac{1}{4}$  of an inch in thickness, the first being previously moistened with a little water. It is next rubbed down in the same manner as the first coat, but acquires a much smoother surface, the plaster being of a finer quality. A day or two afterwards, when it has had time to dry, the third coat is applied. It consists of 4 parts of lime and one of fine white sand. These, after being well mixed, are reduced by grinding to a very fine paste quite free from grittiness. This is put into a large earthen jar of the size nearly of half a hogsheid, and mixed with the white of eggs, scur-milk (Tyre) and ghee, in the proportion of 12 eggs,  $1\frac{1}{2}$  measures of "tyre," and a  $\frac{1}{2}$  lb of ghee to every parah of plaster. These are all thoroughly mixed and rubbed between the hands till the ingredients are thoroughly incorporated and the composition reduced to an uniform consistent paste, a little thicker than cream, and perfectly free from grittiness. The plaster is now fit for use and is put on with a wooden rubber about  $\frac{5}{8}$  of an inch thick, and gently rubbed till it becomes perfectly smooth. Immediately after this, another coat of still finer plaster is applied, consisting of pure lime ground to a very fine powder, and afterwards mixed with water in a clean tub, till it is of the consistency of cream. This is put on about  $\frac{1}{8}$  of an inch thick with a brush, and rubbed gently with a small trowel till it acquires a slight degree of hardness. It is then rubbed with a rock crystal or stone rubber till a beautiful polish is produced, not forgetting to sprinkle the wall with fine potstone (Ballapum) powder during the process of polishing. If the plaster is not entirely dry on the second morning, the operation of polishing ought to be continued until it is quite dry. The moisture, as above directed, must be carefully wiped off, and the wall kept quite dry till all appearance of moisture ceases. The result of the process depends chiefly on the plaster for the upper coat being reduced

to a very fine paste perfectly free from guttiness, and on its being, after it is applied to the wall, rubbed constantly with great care till it is quite dry and has acquired a very fine polish. The wall ought then to be frequently wiped with a fine clean cloth to remove the moisture, and it may be occasionally dusted with Ballapum powder. The stone used in polishing it is rock-crystal or a white quartz pebble about 3 inches long and  $1\frac{1}{2}$  broad, the face of which has a very fine polish. The wall is rubbed with this for one or two days, the moisture being carefully wiped off every morning, and potstone (Ballipum) powder sprinkled on it several times during the day. When the lime is prepared from sea shells, these are first cleaned and washed, and then calcined with charcoal, care being taken to exclude every thing likely to injure the whiteness of the lime. Very white sand only is employed, as common sand destroys the brilliancy of the plaster. When white sand is not procurable, white rock crystal or quartz pebbles reduced to a fine powder may be substituted. Mortar for building consists of one part of chunam and two of sand. Immediately before being used, the mortar is mixed with jaggery water, 1 lb of jaggery being allowed to every parah of lime. It is used in a much more fluid state than is the practice in Europe. When shell lime is used in situations requiring a hydraulic cement, it should be mixed with burnt clay in powder, fresh burnt tiles more or less broken are in general conveniently procured. In building the pier at Masulpatam, Captain Buckle employed a cement consisting of one part of lime, one of the tile dust, and two of sharp river sand, and it appeared to answer well. Jaggery was used in the usual proportion of one pound to a parah of chunam. Limestone abounds in most districts of Southern Asia, but the qualities of the different varieties are best ascertained by experiment. When found in large blocks of very compact stone, the breaching of it forms a considerable item in the expense. Such stone as yields very hydraulic lime is not suited to the purposes of ordinary building, unless the precaution is taken of keeping the work constantly wet. The best form of kiln for burning stone with charcoal is given by Captain Smith in his translation of Vicat, Plate 1, fig 11 and 12. When wood is used the spheroidal form of kiln is recommended. It will be found to facilitate the expulsion of carbon, if the stone is well moistened in water, previous to placing it in the kiln. It should be remarked that nothing but clean sand should be added to the hydraulic limes, such limes

should be used immediately after slaking. When used in situations requiring hydraulic cement, no more water should be used in slaking it than is sufficient to reduce it to a fine dry powder. Magnesian limes have been found at Salem and in the Tanjore district, where it was used with success by Captain Cotton in forming the *ancients* the cement formed with it was stronger than that formed with other lime. It should not be immersed immediately on being used. Much controversy has occurred in regard to the advisability of using the lime while hot, the generally received opinion is that it should be so used, but in regard to the pure limes free from clay and iron, that is without hydraulic properties, this course is questionable. It was not permitted in Rome, and lime mortar kept moist has been found suitable for building after the lapse of several hundred years, lime used hot is seldom thoroughly slaked. A common practice in India is to mix the slaked lime and sand, form it into heaps, on the summit of which is formed a hollow which is kept constantly filled with water. Shell lime, so kept and subjected to the usual beating when used, seemed to Mr Rohde at least as good as when at first burned hydraulic limes, including of course all which become hard under water ought no doubt to be used hot. At Ternate, and other coral islands, coral is largely burned into lime for mortar — *Rhode MSS*

CHUNAMBU TAM Quick lime, Chunam  
CHUNA-KA-PATHAR, lime stone for burning

CHUNAR, a rock fortress in the valley of the Ganges. It is perched on the crest of a limestone spur that rises to the height of 150 feet abruptly from the edge of the stream. The treaty of Chunar between the subadar of Oudh and Warren Hastings was signed on the 19th September 1781. In the fortress is a state prison in which Trimbukjee Dangha pined away his last days hopeless of ever being able to give a second slip to his enemies. *Trav of Hind, Vol I p 132* See Inscriptions

CHURA and Tirah are fertile and well peopled valleys, enjoying a cool climate, in comparison with that of Peshawar, and it was not unusual for the sidars, and others, who had an understanding with the inhabitants, to pass the warm weather in the former of these places, which also frequently became a place of refuge to the distressed At Chura resided Khan Bahadur Khan, Afriedi, who attained immense influence amongst his tribe from the circumstance of his attendance at court during the sway of the Sadoz Zye. Shah Sujah married one of his daughters to, and, on more than one occasion, found an asylum with him The Afriedi occupy the eastern parts of the hills, nearest Peshawar, and the Shinwari the western parts, looking upon the valley of Jelalabad The Orak Zye reside in Tirah, intermingled with the Afriedi, and some of them are found in the hills south of Peshawar. It was a malek or chief of this

tribe who conducted Nadr Shah and a force of cavalry, by the route of China and Tiah, to Peshawar, when the principal road through the hills was defended against him. The Shinwari, besides their portion of the hills, have the lands immediately west of them, and some of the valleys of the Safed Koh range. More westerly still, under the same hill range, they are found south of Jelalabad, and are the neighbours of the Khogon. These are in the condition of vassal subjects. There are also some of them in Ghori band, and they dwell in great numbers bordering on Bajaur to the north west, where they are independent, and engaged in constant hostilities with the tribes of Bajaur and of Kafirstan.

CHURAITIA, a river near Pabnumala in Bogra district.

CHURAKH HIND A wheel, a disease. See Charakh, Siva.

CHURAL HIND Lathyrus sativus.

CHURANG or Chori Ganga, the founder of the Ganga-vamsa dynasty of Orissa. His name is also written Suangadeva. He invaded Orissa in A.D. 1131 and his dynasty ended with rajah Narsinhdeo who, in 1217, built Kanarak, the Black Pagoda. Churing was a benefactor to Juggernaut, adorned it, and peopled its neighbourhood.

CHUTNEE The Chutnee of India is a warm condiment used in every family, either prepared fresh daily from ripe vegetables or preserved. The following is a recipe for the "Delhi or Celestial Chutnee." Take of green mangoes, 1 usins, mustard seed, salt, green ginger, and garlic, each one seer onions (none or) half a seer, dried red chillies half to one seer moist or soft sugar one to two seers white wine vinegar four bottles. The ginger, garlic and onions are to be peeled, and together with the chillies are to be cut into thin slices previously to being pounded, the mustard seed to be washed and dried, then gently bruised and winnowed, the raisins to be washed and freed from the stones, the sugar to be made into a thick syrup, the mangoes to be peeled of their rinds

cut into thin slices (some boil them in three bottles of the vinegar, adding the fourth when mixing them up with the other ingredients) and pounded, the remaining articles are to be separately pounded, and then the whole is to be incorporated, put into a stone jar, well closed and placed in the sun for a month or two. If put into a glass bottle, it should occasionally be put out in the sun. It will keep good for years.

2 *Love-apple Chutnee* Take the love-apple (*solanum lycopersicum*, *Linn*) a large plateful, the rinds and seed to be rejected, and only the pulp used, dried salt-fish cut very fine (as if rasped), a piece about two inches square, six onions cut into thin longitudinal slices, eighteen green *chillies* chopped fine, dried tamarind two *pie* weight (or one ounce), mashed up in about three or four ounces of water (stones and fibres to be rejected), salt, a teaspoonful *ghee* or butter, five *pie* weight (or two ounces and a half). First put the *ghee* into a tinued copper vessel placed on the fire, when it is melted add the onions, and as the latter begin to assume a reddish hue add the *chillies*, stirring them well for five minutes then add the salt fish and continue stirring the whole, when the *ghee* has nearly evaporated add the love apple and stir it about for a good while, lastly, add the tamarind water and salt, and mix the composition well until it acquires a pretty dry consistence (like that of *brinjal chutnee* or *sambal*). This *chutnee* is only for immediate use and will not keep above a day or two.

CHUYAR A hill-tribe in the range bordering Bengal on the west, in Ramgarh and the neighbouring districts — *Wilson*

CHYAVANA, in hindu mythology, is the son of Bhūga, the son of Brahma, by his wife Puloma. A Rakshasi, or fiend, attempting to carry off Puloma, the child was prematurely born, whence his name, from Chya, to fall from. Upon his birth, his splendour was such as to reduce the insulter of his mother to ashes. Having adopted a life of ascetic devotion, he was so immersed in abstraction that he became completely covered with the

nests of white ants. Sukanya, daughter of king Saryata, wandering in the forest, observed what she thought two lights in an ant-hill, and thrust in two blades of kusa grass, which, when withdrawn, were followed by a flow of blood. Much alarmed, the princess repaired to her father and related what had happened. The king conjecturing the truth, immediately went to the spot to deprecate the wrath of the Rishi, and pacified him by giving him the damsel in marriage. After being married some time, the Asvini Kumara, passing by Chyavana's residence, conferred upon him youth and beauty, in requital of which boons he gave them a share in the soma juice offered at sacrifices to the gods. The gods, with Indra at their head, opposed this grant, and Indra lifted up his hand to strike Chyavana dead with his thunderbolt, when the sage paralysed his arm. To appall the gods he created the demon "Mada," intoxication personified, in terror of whom and of the power of the saint, the gods acceded to the participation of the Asvini Kumara in divine honours. Indra was restored to the use of his arm, and "Mada" was divided and distributed amongst dice, women, and wine — *Bharishyat Purana, and the Dana Dharma-section of the Mahabharat*, page 263

Kichorion	GR	Suchal hand of CHLHAB	
Kasni	HIND		

Two varieties of this are grown in many parts of India, from Cape Comorin to the Himalay. Wild chicory vegetates luxuriantly during the summer in Cashmere, and in the Punjab during the cold season. It grows there up to 5,500 feet, and in Lahoul up to 9,500 feet, and the young plant is used as a vegetable. The seeds are used in medicine, and are consequently kept in the bazars. Seeds of both varieties appear to be official, being considered carminative and cordial. The root also is used medicinally. The roots contain nitrate and sulphate of potash, mucilage, and some bitter extractive principle. An infusion of Chicory mixed with syrup causes a thickening of the liquid — *Hornberger*, p 25 *L J Stewart, M.D*, p. 408.

## CIGARS ENG

Chutta	IND	Shutta	TAN
Rokok	MALAL	Tsutta	TEL

Cigars are made all over the south and east of Asia, but the most celebrated are those of Manila, of Chinsura in Bengal, of the islands or Lunka of the Godavery, of Trichinopoly and of Dindigul. See *Cheroots*.

CIMERII The Cimbri or Camri, a Getic race, who entered Europe from Asia. Herodotus (*Melpomene*, p 190) says the Cimmerians, expelled by the Massagetæ, migrated to the Crimea. Here were the Thyssagetæ, or western Getæ, and thence both the Getæ and Cimbri found their way to the Baltic. Rubinius the jesuit, describing the monuments of the Comani in the Dasht-i-Kipchak, whence these tribes came, says, "their monuments and circles of stones are like the Celtic or Druidical remains of Europe" — *Bell's Collection*.

CINCHONA A South American genus, many species of which, have been introduced into India since the beginning of 1861. The sites selected in South India have been near Ootacamund and Neddiamattam on the Neilgherry hills, at an elevation of 5,400 feet, *C. Lucumæfolia* and *C. Paludiana*, to the number of 500,000 plants, had previously been planted by the Dutch in Java. On the Neilgherries, the Government plantations extend over nearly 1,200 acres, while a no inconsiderable extent on the estates of private landholders is covered with the best varieties of the plant. Along the hills of Wynad and in Mysore the cultivation is extending, slowly perhaps, for it is but a secondary care to the planter until he can see his way readily to a remunerative return. A hopeful colony from the Neilgherry stock has been planted at Tounghoo, and promises to multiply for the supply of British Burmah. Upon the spurs of the Darjeeling hills and the other slopes of British Sikhim the cinchona is thriving as well, apparently, as in its native country. Plants may be propagated from seed, and experiments tried upon the Khassiyah hills and other high latitudes upon a less expensive scale, and with more chances of success than from previous efforts. In the Doons, in the North Western Provinces, plants brought from Darjeeling have been successfully planted out

at Chandwallah. In the Kangra district of the Punjab, the cinchona flourishes on four estates, and the early outturn shows that the barks are sufficiently rich in quinine to encourage cultivation on a more extensive scale. There was long a doubt as to the success of the cultivation of cinchona in Kangra. But Major Paske, after a careful inspection of four plantations there, belonging to private persons, reports that the plant has been successfully introduced and will become naturalized. On their estate at Bowarna, the Punjab Cinchona Company have increased the area planted out to 20 acres, on which they have now 14,730 young trees all in healthy condition, and varying in height from five to six feet. Bark taken from branches 2 years and 4 months old yielded, on analysis, 3½ per cent of sulphate of quinine crystallized, or more than in the cinchona barks of the Madras presidency. The experiments in cinchona cultivation did not really commence in Kangra till March 1864. There were, in 1869, 53 acres permanently planted out. The species '*Succubra*,' '*Micrantha*' and '*Calisaya*' thrive best in the valley at altitudes varying from 3,000 to 3,500 feet, while the species *Condaminia* requires a somewhat higher altitude.

The Native States of Travancore and Cochin have evinced a desire to promote cinchona cultivation. By the latest returns there were in the Government gardens at Darjeeling 782,048 plants, and in private gardens, which probably aggregated 170 acres, 232,778. The great work of the Darjeeling plantations has been the naturalization of the *Cinchona calisaya*, the "queen of the cinchonas," which had been reared with less success at Ootacamund. At Ootacamund the area planted out is returned at 1,182 acres, the number of plants at 894,059. The total expenditure from the commencement of operations has been Rs 512,593 or Rs. 21,072 less than the original estimates. But it must be remembered, in comparing the relative expense of the Darjeeling and Ootacamund plantations, that convict labour was employed on the latter for a considerable period. The red and gray barks have been the most successful at Ootacamund, the *Calisaya* ranking only third. The success of Ootacamund barks of the *Cinchona officinalis* has been remarkable. At the last analysis, Mr Howard extracted 11.49 per cent of alkaloids and 9.75 per cent of quinine from the lanceolate variety. The largest extract hitherto known to have been taken from the Peruvian bark is 8.5 per cent, of which five per cent is quinine. Private cultivation upon the Neilgherries is retrograding

in common with all other enterprise. Several years ago a beginning was made in Travancore with 1,628 plants and 5,817 cuttings in the Peermode gardens. No statistics are available of the Derah Doon plantations, but in those in the Kangra valley there were fifty-three acres planted out with 98,972 plants. A late analysis showed that *Chinchona succubra* grown at Kangra yielded 250 of Quinia, a result that cannot but be considered highly satisfactory.

specimens for the opinions of home chemists, we cannot look for cheap quinine nor can we expect that Cinchona plantations will be extended by private enterprise. Of the requisites for the preparation of the bark the more important materials are lime, soda, pearl ash, magnesia, animal charcoal, sulphuric acid, alcohol and other substitutes. The advantage of manufacturing with indigenous alkaloids is more fully apparent in other respects than from its cheapness. The barks yield more cinchona and of a better quality when fresh, and the expensive preparations necessary for safe exportation are altogether avoided. With the exception of sulphuric acid all the materials required in the extraction of quinine have been found on the Neilgherries and in the neighbourhood in sufficient abundance for extensive manufacturing operations, and most if not all of them are to be found in the Sikkim ranges.

CINCHONACEÆ, the coffee tribe of plants of which there are 233 genera and 870 species. Of these 729 species are known to occur in the south and east of Asia, viz, in Zanzibar, Timor, Persia, Japan, each three, in Arabia four, and in India 695.

CINERARIA AZUREA, flowering plants known by the name of Cape Aster, showy flowers of orange, yellow, purple and red coloured varieties. They grow from two to three feet high, the leaves being covered with a soft white down — *Riddell*.

CINGHALESE, a mode of writing Singalese, the people and language of Ceylon.

This is found in commerce native and manufactured. The best *Native cinnabar* is red, heavy, brilliant, of a high colour, and free from earthy or stony matter. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. It occurs native in China abundantly in Shensi, and all the quicksilver (shwin yin "water silver," i.e. hydrargyrum,) not imported into China, is there obtained from this ore, it is said by a rude process of burning brushwood.

Cinchona bark from Neilgherries in 1867, brought 2s the lb, and quill bark 1s 9d. The best samples contained 7 per cent of alkaloids after 4 years' growth.

Scarcely thirty years have passed since Cinchona cultivation was little more than a dream in the minds of Royle, Falconer and a few other naturalists, and a very short period since the first plants were brought to the country. Yet the cultivation which appears to us to be in its infancy would by them have been accepted as the acme of success. This success has been due to the efforts of Mr Clement R Markham who twice went to S America and brought plants to the Neilgherry Hills, and of Mr McIvor of Ootacamund, to whose great skill, Mr Markham attributed entirely their growing. The next step to be taken, is to obtain cheap quinine. Until quinine can be extracted in India and barks analysed without the heavy expenditure that must be incurred in submitting

in the wells, and then collecting the metal after condensation Cinnabar has been discovered at Basein, in Borneo, in a mountain range called Brugo, extending between two branches of the Sarawak river. It yields 84 per cent of quicksilver. For making *artificial cinnabar*, when two parts of mercury and one of sulphur are triturated together the mercury gradually disappears, and the whole assumes the form of a black powder. When this is heated red hot, it sublimes, and if a proper vessel be placed to receive it, a cake is obtained of a fine red colour, which, when reduced to a fine powder, is known by the name of *Vermillion* (*Thomson's Chemistry*). Artificial cinnabar is largely manufactured in Calcutta, and in small quantities at Surat. Manufactured cinnabar is found in all the Tenasserim bazars, but it is imported there. It has been employed in medicine by the Hindoos from time immemorial, to salivate them

patients, which they do most effectually by causing them to inhale its fumes. The Burman name appears to be derived from the Sanscrit Cinnabai or bisulphuret of Mercury is sold in Culeutta in red, striated, crystalline lumps, also in powder, it is often adulterated by red lead and brick dust. It is entirely volatile from a slip of tale, while these impurities remain behind. Compound Cinnabai Ointment, is Captain Aitkin's well known and useful "ringworm ointment"—*Williams' Middle Kingdom*, p. 245 *Mason. Beng Phar* p 382

CINNABRE FR Cinnabar

CINNABRIUM, LAT Cinnabai

CINNAMOMUM, a genus of plants belonging to the natural order *Lauraceae*, confined to Eastern and Southern Asia. Lindley includes in the genus Cinnamomum, the following twelve species

Names	Habitat	Product
<i>C aromaticum</i>	China	Source of Chinese cinnamon according to Nees
<i>C culitlawan</i>	Amboyna	Culitlawan bark
<i>C javanicum</i>	Java and Borneo	{ Bitter and aromatic bark strongly recommended by Blume in periodic colic, and the after pains of labour
<i>C Kramis</i>	Cochin China	Said to produce one kind of Massoy bark
<i>C Loureiri</i>	Cochin China	Flowers of Cassia, and a very inferior cinnamon
<i>C nitidum</i>	India, Java, Ceylon	Furnished the greater part of the old Folia Malabathri
<i>C rubrum</i>	Cochin China	Similar to <i>C culitlawan</i>
<i>C Sintoe</i>	Neilgherries	Similar to do but more bitter
<i>C Tamala</i>	India	Leaves of Folia Malabathri of Indian shops
<i>C xanthoneuron</i>	Moluccas	Similar to <i>C culitlawan</i> , but extremely like Massoy bark
<i>C zeylanicum</i>	Ceylon .. ...	True cinnamon
<i>C zeylan var Cassia</i>	India	Cassia lignea

Dr Wight, in *Icones*, gives figures of the following 14 species —

<i>C albiflorum</i>	<i>C nitidum</i>
<i>C aromaticum</i>	<i>C obtusifolium</i>
<i>C culitlawan</i>	<i>C ovalifolium</i>
<i>C dubium</i>	<i>C perpetuoflorens</i>
<i>C dulce</i>	<i>C recurvatum</i>
<i>C iners</i>	<i>C villosum</i>
<i>C multiflorum</i>	<i>C Zeylanicum</i>

There are however 20 known species, some of which yield cinnamon and others cassia, two aromatic barks which appear to differ from each other in little, except in the degree in which the aromatic principle exists in them. One of these products has been noticed under the head Cassia, and the other will be remarked on under Cinnamon. *Cinnamomum rubrum*, grows in Cochin China, and contains an essential oil, smelling of cloves, but not so agreeable. *Cinnamomum sintoe*, grows on the Neilgherry mountains in Hindustan, and the

higher hills of Java. It is a tree 80 feet high. The bark is in quality very like the true Culitlawan, but not so agreeable, it is more bitter and drier, and more powdery when chewed. *Cinnamomum tamala* is a native of India, wild in Derwancee and Gongachoria, cultivated in the gardens of Rungpoor. The taste of the leaves when dried is aromatic, they are sold in the shops under the name of folia Malabathri. *Tamalapatthri* of India. *Cinnamomum Xanthoneuron* is a tree growing on the Papuan Islands and the Moluccas. The bark has great fragrance when fresh, but loses this quality in time. It is so extremely like Massoy bark as to be confounded with it—*Eng Cyc* p 1089 *O'Shaughnessy*, page 544

CINNAMOMUM ALBIFLORUM NEES

<i>C Camphoratum Bl</i>	Laurus Cassia, <i>Roxb</i>
<i>C Tamala, F Nees</i>	
Dalchini	HIND Tejpat HIND
Tajkalmi, Leaves	

This tree grows in Tipperah, Nepaul and in the Punjab, is not uncommon in the Himalaya east of the Sutlej, grows sparingly at about 5,000 feet as far as the Ravi, and probably in Hazara Part at least of the officinal bark and leaves are probably derived from this tree. The former is given for gonorrhæa, and the latter are used in rheumatism, being considered stimulant. Its timber does not appear to be valued — *Vogt* 708 *D. J. L. Stewart*

### CINNAMOMUM AROMATICUM, NEES & ESEN

*C. cassia*, Blume | *Laurus Cinnamomum*,  
*Laurus cassia*, Nees & Esenl. 3 | *Andr. Repst*

A tree of considerable size, said to grow in the dry sandy districts lying N. W. of the town of Fafoe, between Lat 15 and 16 N. It is said to produce the cinnamon of China and Cochin-China, as also cassia bark and the aromatic fruits called Cassia buds. See Cinnamon

**CINNAMOMUM CITRIODORUM, THW. SINGH** A tree Pangaree Kooroondoo-gass of Ceylon, growing to a height of 20 or 30 feet in the Sufragam district at an elevation of 1000 to 2000 feet. It is distinguished by the venation of its leaves and by the truncated cup of the fruit. The bark has much of the odour of citronella oil, intermixed with something of the fragrance of common cinnamon — *Thw. En. Pl. Zeyl* p. 253

### CINNAMOMUM CULITLAWAN, NEES

*Laurus culitlawan*, Rorb

„ *caryophyllus*, Lou

*Cortex caryophyllodes*, Rumph

A native of Amboyna, especially in Leitimoo near the villages of Sava Rutton and Ema. It also grows in Cochin China. The bark when dry is aromatic like cloves, but less pungent and sweeter. It has some astringency, and owes its medicinal activity to a combination of volatile oil, resin, and bitter extractive. It is used in dyspeptic complaints, diarrhœa, &c. The natives of Amboyna use the oil in both as an internal medicine and as a stimulating liniment — *Vogt* 308, *Eng. Cyc.* page 1089

### CINNAMOMUM DULCE, NEES

*C. chinensis*, Bl. | *Laurus dulcis*, Rorb

A small tree of China, leaves and bark of a sweet aromatic taste and odour — *Rorb* n. 203

**CINNAMOMUM EUCALYPTOIDES, NEES** Grows on the mountains of Malabar. Its leaves have a strong acrid clove-like odour and taste somewhat tinged with camphor. See *quoted by Vogt*

### CINNAMOMUM INERS, REIN

Thet kyau bo	BURU	Ran dal chin	MAH
Len kyau	„	Kot kyau	MALEAL
Wild cinnamon	ENG	SembelaPuh pillu	TAM
Bar-chum	HIND	Pachiku	TEL

This tree is supposed to be the *C. Carui* of Rheede. It grows along the great range of the ghats and in the hilly parts of Malabar and the Concans, in Moulmein, Ataran, Chapedong, Penang, and Java. It is supposed to yield part of the Cassia and Cinnamon of commerce. Its leaves, on being bruised, have a strong spicy smell. The tree is found in the Bombay ghat forests, chiefly to the south, and Dr Gibson says the wood is rather strong, but is little used in house building, or for implements. Dr Wight says it is a tall tree in Coimbatore, rather slender in proportion to its height, the wood is fine, even-grained and supposed very good, but apparently has never been used by the carpenters there, as none of them are acquainted with it — *Dis. Gibson and Wight*

**CINNAMOMUM JAVANICUM**, is a tree with a trunk 20 feet to 30 feet high, growing in Java and Borneo. The bark is of a deep cinnamon brown colour, more bitter than Culitlawan bark, and the leaves, when rubbed, have a very sharp aromatic odour. Blume says the bark deserves the attention of medical men on account of its powerful anti-spasmodic properties — *Eng. Cyc.* page 1098

**CINNAMOMUM KAIMIS** See Cinnamon

### CINNAMOMUM LITSEÆ FOLIUM, THW.

Koodoo Kooroondoo-gass, SINGH

A tree of fifty or sixty feet, growing at Hapootelle in the central province of Ceylon at an elevation of 5,000 feet. Its bark is quite odoriferous — *Thw.*

### CINNAMOMUM LOUREIRII, NEES.

Kio kin, CHINA | Ni-kei, JAPAN

Grows on the lofty mountains of Cochin China, to the west towards Laos, and in Japan. The flowers of Cassia are produced by this species. The old and young branches are worthless, but the middle-sized shoots are superior to that of Ceylon, and are sold at a much higher price — *Eng. Cyc.* page 1089

### CINNAMOMUM NIDITUM, NEES.

*C. Cassia*, Nees, W. Ic

Kidigi hundi,	AR	<i>C. Cassia</i> Nees,	W. Jo
Tej-pat,	BENG	<i>Laurusnidit</i> ,	ROXB
Sadiu,	HIND	Putruj (bark),	HIND
		Tamalapatia,	SANS

Described as a tree of Sumatra, and as a small tree or shrub on the continent of India. Its flowers are small and of pale yellowish colour, and the bark is cinnamon-like in taste and odour. It is the plant which furnished the principal part of the 'Folia Malabathri' of the old pharmacologists — *Eng. Cyc.* p. 1089.

### CINNAMOMUM OBTUSIFOLIUM, NEES

*Laurus obtusifolia*, ROXB | *L. Malabathrica*, ROXB

A tree of the mountainous countries immediately east of Bengal, with small green-

ish yellow flowers Its timber is very useful for various purposes — *Roxb* 302, *Voirst* 307

## CINNAMOMUM ZEYLANICUM BREYN

*Nees* II

*C ceylensis*-coronde, *Blume* *Nees*

*Var* *β. multiflorum*

*C multiflorum*, *W* *Ic* | *C dubium*, *Nees*  
*C perpetuiflorum*, *W* *I* | *C villosum*, *W* *I*

*Var* *γ ovalifolium*

*C ovalifolium* *Wight*

In addition to the above synonyms, Mr Thwaites (*En Pl Zeyl*, p 252) strongly suspects that *C obtusifolia*, *N* *ab* *E* *Ic*, p 36, *cum* *syn* *Wight*, *Ic* t 139, *C biza-*  
*m*, *N* *ab* *E* *Ic* p 26, *cum* *syn*, *C malaba-*  
*thrum* *Bitka*, *N* *ab* *E* *Ic*, p 38, *cum*, *syn* *C*  
*mers*, *Wight*, *Ic*, tt 122, 122 bis, 230, and *C*  
*nitidum* *N* *ab* *E* *Ic*, p 43, *cum* *syn* *Wight*  
*Ic* t 124, will prove to be mere forms of the  
present species He thus further observes  
“without the opportunity which I have had  
of seeing numerous examples of this very  
variable tree, I should scarcely have ventured  
to unite the above enumerated varieties under  
one specific name, so unlike one another are  
the extreme forms of each, but in a large  
series of specimens it is frequently difficult,  
or even impossible, to determine to which  
variety to refer some of them, so interme-  
diate are they in character The best cinna-  
mon of commerce is the produce of what I  
consider a cultivated or selected form of *var*  
*α*, and the trees of this form have usually  
large leaves of somewhat irregular shape, but  
the barks of all the forms of this species pos-  
sess the odour of cinnamon in a greater or  
less degree, and it is not always possible to  
judge of the quality of the bark from the fol-  
iage, for I have observed the cinnamon-peel-  
ers, when collecting bark from cultivated  
trees, taste a small portion before commencing  
their operations, and pass over some trees as  
unfit for their purpose The bark of *β* and  
*γ* is of very inferior quality, and I have been  
informed is never collected, except for the  
purpose of adulteration A fragrant oil, sold  
under the name of “Clove oil,” is obtained  
by distillation from the leaves of the culti-  
vated cinnamon tree, and the roots yield,  
under a similar process, a certain quantity of  
camphor The ripe seeds contain some amount  
of stearine, but I cannot learn that it is now  
extracted for any purpose” *Thw En Pl Zeyl*  
p 252

Cinnamon is the bark of *Cinnamomum*  
*Zeylanicum*, *Nees* *con* *Esenbeck*, (*Laurus*  
*Cinnamomum*, *Linn*), and the True Cinnamon  
of the shops Cinnamon is the *Kinnemon* of  
Exod xxx 23 (see BibleCycl ii p 210), and  
the *Kivvupáwpov* of Herodotus, a name which he  
states the Greeks learned from the Phœnicians  
The name seems derived from the Singalese  
*Kalynnama* (dulce lignum), or the Malay  
*Kainamams*, which Mr. Marshall says is some-  
times pronounced *Kainamams* (*v Antig of*  
*Hind Med* 84 and 141) Two varieties of  
cinnamon are known in commerce, that of  
Ceylon and Ceyenne and the Chinese cinna-  
mon, which is of far inferior quality, and  
often smelling most distinctly of bugs A  
third species, considered by Fee to be the  
bark of the larger branches and trunks of  
cinnamon trees, grown in all sorts of soils  
and localities, is the Mato cinnamon of the  
Portuguese (*Canella mata* or *plata*) the wild  
*canella* of the Dutch, and the Kapoor Cou-  
ronndon of the Ceylonese

Ceylon has ever been the chief place of  
production From the earliest period at  
which any record existed concerning the use  
of this spice, and which extends back to the  
days of the Roman republic, up to the year  
1760, during the latter portion of the Dutch  
rule in Ceylon, cinnamon grew, in a wild state,  
amongst the thick jungles of the low and hilly  
country, the best always having been cut  
upon the light soil of the maritime provinces  
The tree is found only in the western, south-  
ern and central provinces, and there appears  
little doubt that it was the abundance of cin-  
namon growing on the west coast of the  
island, which induced the first Portuguese  
settlers to fix the seat of their government at  
Colombo, a spot devoid of any harbour or  
shelter for shipping In 1833 the trade in  
this article was thrown open to the public,  
and six years later the government commen-  
ced the sale of their preserved plantations by  
monthly auctions In this way the whole of  
them, with but one exception, have been dis-  
posed of, chiefly to the British merchants and  
capitalists The forests are still searched for  
the jungle cinnamon by the natives, especial-  
ly when there happens to be a little better  
demand for the spice, but the quality of this  
sort is far below that of the cultivated bark,  
as much as three fourths of it being generally  
devoid of any flavour or aroma During the  
early part of the Dutch rule in Ceylon their  
yearly shipments amounted to 10,000 bales

of 88 lbs each, of which 2,000 were for India, Persia and Arabia. These latter places have long ceased to take any cinnamon, whilst the exports to Europe have been reduced to 7,000 bales of 100 lbs in 1849, 6,000 bales in 1850, and 5,800 bales in 1851, although the selling price in the London market had been brought down to about one-third to that realized twenty years before. In 1835, the export duty in Ceylon was 2s 6d, and 2s, according to quality, it is now only 4d per lb on all sorts. Almost all the Ceylon cinnamon is sent to Britain, and in the five years 1846 to 1850, the average imports amounted to 251 tons, but Britain uses only about 14 tons and the rest is all re-exported. *Capper Thwaites O'Shaugh Statist of Commerce Royle*

**CINNAMON STONE** One of the inferior gems. It is found in Ceylon. See Gems

**CINNAMUS** See Greeks of Asia

**CINNARA**, are geni, and male dancers in Swaiga, the heaven of Indra. — *Sw W Jones*, p 270, p xiii. See India

**CIRCAETUS GALLICUS**, Gmel. The Common Serpent Eagle

C brachydactylus Meyer

Serp maril	BENG	Pimula gedda	TEL
Mal patar	CAN	Rawul of the Wagri	
Samp mar	HIND	Kondatelle of the Yer-	
Pambu Prandu	TAM	lahi	

This Serpent Eagle is found in the south of Europe, North Africa, common all over India and Asia, has been killed in Denmark, but never in the British Islands, prefers the open ground, queeting like a harrier. It eats any creature, but snakes and lizards are its chief food, hovering in the air, and pouncing down suddenly like a stone. It seizes the snake by the head with its talons, and the snake often twines its body around the bird and so encumbers it that it is occasionally so caught. *Jerdon*

**CIRCAR** In the mahomedan land revenue system, Circar is a sub division of a Soobah. The N W Provinces of India, excluding the Saugor and Nerbudda Territories, comprise no complete soobah, but only portions of the four soobahs of Agra, Allahabad, Delhi, and Oudh. Each soobah was divided into a certain number of Circars, and each Circar into Pergunahs or Mehals, (which are used as equivalent expressions) and the Pergunahs again are aggregated into Dustoors or districts, and as the Pergunah of

the same Dustoor are of course always contiguous, the Dustoor statement in old Registers, if copied with any regard to correctness, frequently forms a very important means of the verification of doubtful names. Soobah is an Arabic word, signifying a head of money, or a granary. Circar is literally a chief, a supervisor. Dustoor, besides signifying a rule, is also a Minister, a moonshiee. Pergunah means tax-paying land, as well as a perfume composed of various ingredients. The title of Soobahdar, or lord of the Soobah, is long subsequent to Akbar's time. Sipahsalar was then the only designation of the Emperor's Viceroy in each Soobah. Under the British, the country known as the Northern Circars stretches for 470 miles from Orissa southward between the Eastern ghauts and the sea. It was not till A D 1476, that the mahomedans of the Deccan extended their arms to the Northern Circars. At this time Oriz, the rajah of what is now the Ganjam country, died without issue, and his adopted son Mungul Roy, and his cousin Humner (?) became competitors for the succession. During Mahmoud's time (in 1512), the Bahmnee Dynasty was dismembered, and five Deccanee kingdoms set up. The country now known as "The Northern Circars," fell under the dominion of the Kootub Shahee states, whose capital was Golconda or Hyderabad. That portion south of the Godavery became tributary without difficulty, Wistna Doe or Gajeputti, a powerful prince of Orissa, who ruled in Rajahmundry and Chieacole, withheld submission, and it was not till A D 1571 that his pretensions were lowered. The Northern Circars territory was occupied by the British in 1766. — *Elliot Annl Ind Adm Vol XI 243*

**CIRCASSIA**, the Cherkas or Tcherkass of Asiatics is on the northern face of the Caucasus. It contains many tribes of various appearance and dignity, some of whom allege an Arab descent, others are Tartars from Changish Khan. They divide themselves into three classes, princes, nobles, and vassals, the latter, like the clans of Scotland, being faithfully attached to their chieftains. Their young women are famed for their beauty, and are sought for in the neighbouring kingdoms. They are brought up in simple and domestic habits by their mothers, are taught the use of the needle in decorative works, and to make their own clothes and those of the men of their family, and are otherwise very carefully reared.

Soon after a girl is born, her waist is encircled by a leathern bandage, sewn tight, and which only gives way afterwards to the natural growth of the child. It is then replaced

by another, and so on, till the shape is completely formed, according to the taste of the country. On the marriage night, the husband cuts the cincture with his poignard. After marriage the women are kept very close, not even their husband's own relations being suffered to visit them, but a man has no objection to allow a stranger to be alone with his wife. For it is a strict rule with the Circassians, never to be seen by a third person in the presence of their wives. Among other tribes of the Caucasus, and particularly that of the Kist, when a traveller arrives at one of their abodes, the host orders one of his daughters to do the honours of his reception, to take care of his horse and baggage, to prepare his meals, and to remain with him. With the natives of a part of Lapland, not very far from Torneo, the wife of the host takes care of his guest during his sojourn under her husband's roof. The tribes seem to have been of dissimilar origin, but they are alike famed for the warlike habits of the men and the beauty of their young women. In the time of Selim I the Mamaluks were all slaves of pure Circassian blood. More recently, only the Borgite Mamaluks were of Circassian origin — *Notue of Circassians, by Charles Tauschin Porter's Travels, Vol I p 141, 144 Lond As Trans Vol I 93* See Kabarda

**CIRCLE**, under the form of a winged circle, the Assyrians worshipped the supreme deity. The buddhist wheel of the law to be seen on the Caves of Ellora and Ajunta was probably borrowed from the Assyrians, as it reminds us of the wheel within wheel of Ezekiel — *Cal Rev 1868*

**CIRCUMAMBULATION** of sacred places, has ever been part of the ritual of worship of Asiatic nations. The mahomedan in circumambulation "Touf," presents his left shoulder, the hindu in Pradakshina walk round with the right side towards the fane or idol, and the buddhists turn similarly. The latter would appear to be the original form of the rite. Its conjectural significance is an imitation of the procession of the heavenly bodies, the motion of the spheres, and the dances of the angels. These are also imitated in the circular whirlings of the Dervishes. El Shahistani informs us that the Arab philosophers believed the sevenfold circumambulation to be symbolical of the motion of the planets round the sun. It was adopted by the Greeks and Romans, whose Ambaivalia and Amourbaha appear to be eastern superstitions, introduced by Numa, or the priestly line of princes, into their pantheism. And in Britain the processions round the parish pre-

serve the form of the ancient rite — *Burton's Pilgrimage to Meccah Vol III p 204*

**CIRCUMBARI**, a small town in the Carnatic in L 13° 39' N and L 79° 32' E near Tripaty. It is 360 feet above the sea.

### CIRCUMCISION

Khutna, ARAB | Soontan, HIND

The Phœnicians had this rite in common with the Egyptians and the Jews, and they acknowledge having derived it from the former. According to Bunsen (iv 273) it was not followed amongst the Phœnicians. The Egyptians and Jews were alike in the practice of circumcision (Herodotus ii 36). It seems to have been a Semitic rite, which Abraham revived, for Abraham was 99 years old when he circumcised himself, Ismael his son was thirteen, and Isaac was one year old.

This rite is practised amongst all the Jewish people and most mahomedans. The prescribed time is in infancy, though the poverty of the parents and other circumstances sometimes retard its performance. It is performed with some ceremonial and in presence of the friends of the family. Amongst the people in the gulf of Carpentaria, all the males before the age of 12 or 14 years undergo this rite. This custom is not derived from the Macassars, the latter affirming that it existed previous to the commencement of their intercourse with the coast. But this singular custom is not confined to the tribes of the north-west horn of the Gulph of Carpentaria. Flinders observed a case upon the Wellesley Islands, and the custom is also prevalent amongst the natives of certain parts of the south coast of Australia. It will be difficult, perhaps impossible to discover now the origin of this custom. Mr Earl observes that a peculiar formation prevails among the aborigines of this part of Australia, and also of the adjacent coast of New Guinea, which renders the practice exceedingly conducive to comfort and health. The rite of circumcision is not once mentioned in the Koran. It is considered as an act of imitative practice, founded on the example of the disciples, but not on that of Mahomed himself. In Oman, on the shores of the Persian Gulf, among the christians of Atyssinia, and in Egypt among the Arabs and Copts, the custom is prevalent. At Bosra and Bagdad, all the women of Arabian blood circumcise their daughters as well as their sons. At Kahra, the women who perform this operation are as well known as midwives. They are openly called into houses from the streets, without any secret being made of the intention with which they are invited. This is noticed by several mahomedan writers viz, in the Dur ul-

Mukhtar, the Tahtavi, and Fattah-ul-Muain, and according to the last book, it is the inner Libya that are removed — *Earl in Ethn Lib Vol I Niebuhi Travels, Vol II, 250, 251 Malcolm's Hist of Persia, Vol II, p 339 Bunsen's Egypt, iv, 273 Herodotus lib II, 36*

**CIRCUS**, a genus of birds of the order Raptores or birds of prey, and sub-family Ciconiæ

*Circus cinquosus* ('Marsh Harrier') Europe, Asia, N Africa very common in India Migrates in Scandinavia

*Circus cyaneus* Hen Harrier of Europe, Asia, Africa the American *C uliginosus* barely, if at all, separable In India common in the Sub-Himalaya region and its vicinity being replaced southward by *C. Swainsoni* (*Pallidus* of Sykes)

*Circus cineraceus* (*C Montagu* 'Montagu's Harrier') Europe, S Asia, Africa very common in India

*Circus Swainsoni* (the *Pallidus* of Sykes) is regarded by Professor Schlegel as a local variety of *C cineraceus*, had he said so of *C cyaneus*, it would be more intelligible, as the affinity is much closer with *cyaneus*, nevertheless, both *Swainsoni* and *cineraceus* appear to be common throughout Africa, as both likewise are in India, inhabiting the same districts, and each remaining ever true to its distinctive characters, while *cyaneus* also inhabits the vicinity of the Himalaya, together with both the others See Aves, Birds

**CIS-SUTLEJ STATES** By the treaty with the sovereign of the Punjab, Runjeet Sing, of the 26th April 1809, he undertook not to make or allow any encroachment on the states on the left bank of the Sutlej. The largest of these were

Puttiala.	Kulsiah	Dzalguish
Jheend.	Maleir Kotla	Mumdot
Nabha.	Fareedkot	Raikot

*Puttiala* was formed by a Jat family, of the Sikh religion, who emigrated from the Manjha, about five generations back. The area is 5412 sq m with a population of 1,586,000, and a revenue of Rs 30,00,000.

*Jheend* territory has an area of 1236 sq m and a population of 311,000 souls, with a revenue of four lakhs of rupees. The maharajah is a Jat, of the Sikh faith, and of the same descent as the maharajah of *Puttiala*. In 1857, this chief was the first person who marched against the mutineers at Delhi.

*Nabha* territory has an area of 863 sq m, a population of 276,000 souls, and a revenue of four lakhs. The chief is of the same stock as the maharajahs of *Puttiala* and *Jheend*, but is the elder branch of the family. The family behaved ill in the Sikh war of 1845-6, but did well in the revolt of 1857, and were rewarded by a grant of land out of the Jhujjur territory.

*Kulsiah* territory has an area of 155 sq m, and a population of 62,000 souls with a

revenue of Rs 1,30,000. The family came from the village of Kulsiah in the Manjha.

*Maleir Kotla* has 156 sq m, with a population of 46,200 souls, and a revenue of one lakh. The family came originally from Kabool.

*Fareed Kot* consists of *Fareed Kot* proper, and *Kot-kupoorah*, is S W. of *Ferozpur*, borders to the S E on *Patiala*. It has an area of 643 sq m and a population of 51,000 souls, with a revenue of Rs 75,000.

*Mumdot* is a mahomedan chieftaincy, and was re-established in 1863.

The minor Cis-Sutlej chiefs were deprived of their sovereign powers, and the police management of their estates was assumed by the British Government, all customs duties were abolished without compensation, except in the case of the Nawab of *Konjpoora* and the mir of *Kotahai*, and the chiefs were reduced to the rank of ordinary jaghiredars. These were eighty in number, with revenues varying from Rs 250 to Rs 71,900.

**CISTACEÆ**, the Rock-rose tribe of plants, one genus is the *Helianthemum*.

**CISTICOLA CURSITANS** FRANKLIN The Grass warbler of Ceylon, *C schænicola*, Bonap. That from Algiers is undistinguishable from Indian specimens, unless it be that the average size is rather larger, and the black upon the crown predominates more. If procured in India, this Algerian specimen would scarcely be remarked even as a slight variety — *Mr Blyth's Report*.

**CISTICOLA OMALURA**, and *C ruficeps*. See Birds.

**CISTI TREES** The *Cytinus hypocistus*. See Balanophora.

**CISTUDO**, a genus of reptiles of the family *Chelonia*, of which *C Amboniensis* occurs in Amboyna, *C dentata* in Java, and *C trifasciata* in China. See Reptiles.

**CITIA-MERDU** MAL *Memispermum cordifolium*.

**CISPE** also **LADENIFERE** Fr *Ladanum*, or *Ladnum*.

**CITHERN** ENG A musical instrument, supposed to have obtained its name from the *Sil-tara*, the three stringed lute of the East, supposed to be the source of the *violin*.

**CITRACEÆ**, or **Anantiaceæ**, **Citron** Worts, or the Orange Tribe are dicotyledonous polypetalous plants, and the Orange, Lemon, Lime, Shaddock, Pomelmoose, Forbidden Fruit, and Citron are the produce of this order. The *Wampra*, a fruit highly esteemed in China and the Indian Archipelago, is produced by *Cookia punctata*. The fruit of *Glycosmis citrifolia* is delicious, and that of *Triphasia* very agreeable. The *Ægle marmelos* is used in medicine and a perfume is made from its rind.

A small round gourd commonly cultivated along the line of the Indus from Lahore to Sind, said to be merely a cultivated variety of C. cucurbita. It is cooked as a gourd, and has a pleasant flavour when young—Dr J. L. Stewart			

CITRUS, a genus of plants of the natural order Citraceæ, several species of which grow wild, or are cultivated in the south and east of Asia, and all of them furnish useful products. Citraurantium, of Risso, yields its fruit, the orange, one essential oil from the rind, another from the flowers, the oil of neroli, and the wood is also of value in the arts. Citrus decumana of Linnæus furnishes the valuable pumalo or shaddock fruit, and the Cumquat fruit of China is from the Citrus olivæformis. The lime fruit of the Citrus limetta of Risso, is valuable for its juice, the lime juice which is used, as a preservative from sickness, and the Citrus limonum of Risso furnishes the useful lemon fruit, the rind of which yields an essential oil, or is used in cookery as lemon peel, while the juice of the fruit forms a source of the lime juice. Independently of the historical fact that citrons and lemons at least were obtained from the Persians, it is certain from the researches of Wallich and other Indian botanists, that it is among the lower ranges of the hills in Nepal, and extending most probably into China also, that the wild plants of the genus Citrus find a home

The orange is not mentioned by the ancient authors, either of Europe or Arabia, and is supposed to have been introduced into Europe after the middle ages. Dr Royle states that the orange and lemon are natives of India, the orange being found on the Neilgherries, on the borders of the Sal forests of Sylhet, and, perhaps, also in China. Mr. W. Elliot states that a very small variety of the orange ("Ida-chettu, TEL," "Chota

kichili, HIND, "Kini kittali, CAN," which is the C variatio of Heyne, 57 Musk orange) grows both cultivated and wild in all the hilly country of the Circars, and, he asks, if it be the original of the cultivated Citrus aurantium. The orange tree is extensively cultivated. The finest sorts are the Cintra, Cowlah, and a small sweet orange which grows on a tree more like a creeper. The principal method of culture is by budding, the stock generally being either seedlings or cuttings from the sweet lime. The best Cintra, with a thin close rind, is produced upon the seedling stock, and it is said that the fruit grown upon the sweet lime stock is generally close and soft; this is very perceptible with some of the oranges. The best time for budding is in the cold season. The leaves are rather bitter, and contain essential oil. A still more fragrant oil, called oil of neroli by the perfumers, is afforded by the flowers. The berries while unripe are gathered, dried, and turned in the lathe to the size of peas, and are used in issues on account of their fragrant odour. The rind or peel of the orange is bitter and aromatic, and affords a very useful stomachic tincture and syrup. The juice of the ripe fruit contains sugar, malic and citric acids, citrate of lime mucilage, albumen and gum. Like the lemon juice it makes an excellent cooling drink, and is an invaluable specific in the treatment of scorbutic diseases. The seeds of the orange yield oil by expression, but not available in any quantity.—*O'Shaughnessy Eng Cyc*, p 1120 *Vogt, Elliot, Ainslie, Royle, Riddell*

This is the shaddock of the West Indies. It is the largest of the orange tribe, and is largely cultivated in Southern Asia in gardens, the varieties are red and white, the former being preferred by some persons. The tree grows to a large size in a rich soil, and requires much pruning, the best time for doing this is when the crop of fruit is off, fine fruit has been produced from the seed. The tree, when planted, should have a space of twelve feet all round it. The blossom is used for flavouring sweetmeats. It is a fine fruit, cooling and aperient, and in taste somewhat resembles a fine orange.—*Ainslie*, p 231. *Riddell Mason Roxb* in, 393

CITRUS GALGALA At Lahore, a species of lemon the size of a double fist, called Galgala, is pickled for domestic use and much eaten by the natives.—*Hornberger*, p 258

CITRUS JAPONICA The "Kumquat," is extensively grown by the Chinese in pots and at one season of the year the plant is literally covered with its small, oval, orange-coloured fruit. This, as well as various other species of the orange, is mixed with the forced flowers, and together produce an excellent effect. It is grown in Chusan, in groves, on the sides of the lower hills. The plants are all arranged in rows about four feet apart, average three or four feet high, and do not exceed six feet. Mr Fortune thinks if the "kumquat" were better known in Europe, it would be highly prized for decorative purposes during the

winter months. It is much more hardy than any other of its tribe, it produces its flowers and fruit in great abundance, and it would doubtless prove a plant of easy cultivation. In order, however, to succeed with it as well as the Chinese do, one little fact should be kept in view, namely, that all the plants of the orange-tribe which bear fruit in a small state are grafted — *Fortune*, p. 122

## The Peel

Lemon Peel	ENG	Zitronschellen	GER
Lames d'ecorce de citron	FR	Scoize de limone	IT
		Coletezas de citra	SI

Dr Royle found this tree, apparently wild, at the foot of the Himalaya mountains. It grows also in the Gair hills, but it is extensively cultivated, its fragrant white flowers are tinged with red.

The essential oil obtained from lemons is yellow, light, very volatile. It is prepared by rasping the lemons until the oil-vesicles are removed. These are then pressed between glass plates, and the expressed juice allowed to stand till the impurities subside. This oil is composed of 10 atoms carbon and 8 atoms hydrogen, (citrene). If a current of muriatic acid gas be passed through it at a low temperature, it concretes into a solid mass of nentral crystals, containing one atom of muriatic acid, and forming a salt called muriate of citrene. This oil is used chiefly to give flavour to various medicinal mixtures, and is seldom or never employed by itself. Its rind, called *Lemon peel*, is of a pale yellow colour, rough, dotted, odorous, and bitter, it is used principally, like the oil, for imparting its aromatic taste to medicines, and as a gentle aromatic stimulant. Its juice, the *Lemon juice* of commerce, contains nearly 2 per 100 of citric acid, water 97½, the remainder being gum, malic acid, and extractive matter. In scurvy, lemon juice has long been esteemed as a certain specific. As it is difficult to preserve the juice on long voyages, citric acid and the essential oil have been in several cases substituted for the juice

itself. It is a most grateful and useful material for the preparation of cooling drinks — *O'Shaughnessy Royle Roxb* in 142 *Voigt*

## CITRUS MADURENSIS LOUR

Matulunga	SIAM		

Grows at the foot of the Garrow hills but is cultivated and grows to a large size, the outer rind very rough and covered with excrescences, and when ripe of a deep yellow colour and fragrant, used to form a preserve, and the juice is made into lemonade. It is propagated by cuttings, layers, or seed. A Chinese variety has been named *C digitata* — *Voigt* 142 *Roxb* in 392 *Riddell*

CITRUS MONOPHYLLA Grows wild along the Western Ghats of the peninsula of India — *Riddell*

CITRUS NOBILIS LOUR Syn of Citrus aurantium, Linn

CITRUS TOROSA Grows at Tavoy with a leaf that looks like two leaves joined together, the wings on the petiole being as broad, or even broader, than the leaf itself. The fruit is small, and there are two varieties, one with a smooth, and another with a rough skin. Mr Mason does not find it noticed in any of our Indian Floras, but Dr Pickering met with a similar tree on the Samoan Islands, a member of the Philippine Floras — *Mason*

CITRUS TRIFOLIA A native of China, and the fruit is about the size of a marble

## CITRUS VULGARIS

Bitter Seville orange	ENG	C Bigarradia	Duhamel
-----------------------	-----	--------------	---------

The leaves differ from those of the sweet orange by the petiole only. The flowers are alike in both species. The rind of the fruit is bitter, acid, and hot to the taste, the pulp acid and bitter, the seeds excessively bitter. The bark of the tree participates in these qualities. The rind of the fruit is used in making the celebrated liqueur "Curacao" — *O'Shaughnessy*,

**CITRUS WOOD** of the Romans was extravagantly prized for tables, and is supposed to have been the *Callitis quadrivalvis*, *Vent*, or jointed arbor-vitæ, the conifer which yields the gum sanderach. The wood was distinguished as striped, "tigrinæ," spotted "pantherinæ," or speckled 'apiatæ,' Cicero gave £9,000 for a Citrus-wood table.

**CITTURA CYANOTUS**, is the forest kingfisher of Celebes, along with it occur the Mero-pogon Forsteri, Carpophaga Forsteri, a fruit pigeon of North Celebes, Buceos cassidix, the great horn-bill of Celebes, Trichoglossus ornatus, a beautiful brush-tongued parouquet, Corvus advena, a rare black and white crow.

**CITY** of the Willows, name of a secret society amongst the Chinese. It is political.

**CITYSUS CAJAN** LINN, *Roxb*, *Willde* syn of *Cajanus Indicus*, *Spreng* *W A*

Castoreum	LAT	Kasturi	TEL

The civet perfumes of commerce are obtained from two sources. One of the civets is a concrete substance obtained from two small bags in the preputial follicles of the beaver, Castor fiber, of both sexes. This is the Civet Castor of North America, and is imported into India for medicinal purposes. A kind of castor or civet is also obtainable from the civet cats. Civet is used in perfumery, and has a powerful scent, resembling musk and ambergris. The civets (*Viverra*), a genus of carnivorous animals, approach nearest in their form and habits to the fox and the cat. But the distinctive character of the civets consists in an opening near the tail, leading into a double cavity of considerable size, furnished with glands for the secretion of this odorous substance. When the secretion is in excess, the animal frees itself from it by a contractile movement, which causes the civet to ooze from the bag. This is carefully collected and sold (not without adulteration with butter or oil, to increase its weight) at a very high price — (*O'Shaughnessy*, p 614 *Eng Cyc*). In Malay and Javanese this perfume is known by the native names of rase and dedes, but the Sanscrit Kasturi and the Arabic zabad corrupted jabad, are also used as synonyms, and doubtless the Dakhani Javad, Malay, Jabad, Eng Civet, French Civette, and

German Zibeth, are all from the Arabic Zabad. In the Eastern Archipelago, this article is produced by two distinct species of *Viverra*, *V rase* and *V zibetha*, which are kept in a half domesticated state for the purpose of yielding it. The first is a native of Java, and the last of the other large Eastern islands, where the natives of rank are great consumers of this perfume, a not generally acceptable one to Europeans — (*Crawford Dic*, p 100). A variety of this termed Poollughoo Shuttum, *Tam*. Javad, *Duk*, Civet Cat Perfume, *Eng* Ghendamaly alubeeyum, *Sans*, is an inferior sort of Musk bag procured from a species of civet cat, *V zibetha*, found in many parts of lower Hindoostan. This animal is called in Tamil, Poollughoo poonay, and in Telugoo, Poonghoo pulhe. The article is chiefly used by the people as a perfume and in the preparation of certain liniments — (*Ans Mat Med* p 192). These animals are carefully kept and tended in North Africa, for the sake of the perfume; they are also common in South America and in the forests of Japan. Civet contains free ammonia, resin, fat, and extractiform matter, and a volatile oil to which its odoriferous properties are due. It is imported into England from the Brazils and from Guinea. When genuine, it is worth from 30 to 40 shillings an ounce. The civet cats of the south east of Asia are as under,

<i>Viverra Malaccensis</i>	Gmelin
" <i>rase</i>	Horsfield
" <i>gunda</i>	Buchanan Hamilton MSS
" <i>indica</i>	Geoffroy
" <i>Bengalensis</i>	Gray Illustr
" <i>pallida</i>	Gray Illustr
<i>Genetta Manillensis</i>	Eydoux

The odoriferous substance which the Indian civet-cats secrete is identical with civet, though not the civet of commerce of Europe. This species is not infrequently found in the Burmese villages, and its secretion enters into the Burmese Materia Medica. In Burmah Mr Mason says there are,

<i>V zibetha</i> , Linn	<i>V orientalis</i> , Hodgson
" <i>undulata</i> , Gray	" <i>civettoides</i> "
" <i>melanurus</i> , Hodgson	

Another species of civet cat, the Burmese call "horse-cat," from the mane on its neck. — *Mason Ainslie Tomlinson Crawford O'Sh McCulloch*

#### CIVETTE FR Civet

**CLADANTHUS ARABICUS** Small dwarf plants, bearing yellow flowers — *Riddell*

**CLAM**. ENG A mollusc of the genus *Tridacna*, common in many parts of the world. There are six recent and one fossil species known, and the great clam shell of the Archipelago is used in Europe for church fonts.

**CLANGULA GLAUCION** (*Fulgula clangula*, 'Golden Eye') This bird takes the

circuit of the northern regions, N Africa, Sindh, Panjab See Birds

**CLANSHIP**, somewhat resembling the form it assumed in Scotland, prevails amongst several of the Afghan and Baluch races, where the adjoining tribes have not as yet amalgamated into nationalities. Moral worth, national pride, love of country, and the better feelings of clanship, are the chief grounds upon which a great people can be raised. These feelings are closely allied to self-denial and a willingness on the part of each man to give up much for the good of the whole. By this, chiefly, public monuments are built, and citizens stand by one another in battle; but all these are wanting from most of the races occupying British India at present. Many of the rajput races are in claus, and mahomedanism has given a bond, but even it is not strong, and China has two distinct races, the Chinese and the Tartar wholly separate in civilization and in aspirations.—*Sharp's History of Egypt Vol I, p 278*

**CLARET** Eng A term generally used to designate the red wines, the produce of the Bordelais. The most esteemed are Latite, Latour, Chateau-Margaux, and Haut-Brion. In France, *Claret* is a general name for all red coloured wines and what the English call Claret is styled Bourdeaux.

**CLARIFIED BUTTER** Ghee HIND

**CLARKIA**, a genus of exotic flowering plants handsome annuals which make a showy display in flower borders, their colours are rose white and purple, they ripen seed in abundance which may be sown in any good soil. *C elegans* and *C pulchella* are both from California.

**CLARO-BABUYAN**, one of the Babuyan or Five Islands of the Archipelago

**CLATHRARIA** See Dracena.

**CLAUDIUS CÆSAR**. The first authentic

**CLAUSENA**. A genus of plants belonging to the natural order Citiaceæ. They are shrubs or small trees, and were classed by Roxburgh under the generic name of *Amyris*. *C heptaphylla*, *W and A Karun-phul*, *Hind* grows in Bengal, has small flowers, greenish yellow, and anise scented, and its bruised leaves have the fragrance of fresh anise seeds. *C. nana* grows in the Moluccas, *C punctata*, and *C suffruticosa*, grow in Chittagong, and the fresh leaves of *C. Sumatrana*, when bruised, have the fragrance of a lemon leaf. *C Wildenowii* *W and A*, grows near Chingleput, and *C pubescens*, *W and A*, in the Peninsula. *Voyt* 140, 147 *Rorb* 11, 248-251

**CLAY** Eng

Chomar	HEB	Tannab (white	
Gil	HIND	clay)	MALAT
Chikni mitti	"	Sangli dalam	
		(fire clay)	HIND

**CLAY**, a compound, or perhaps only a mixture of the two earths, alumina and silica, with water; clay is an essential ingredient in all fertile soils. The following are some of the common varieties of clay—

1 *Pipe clay* Namum, *Tamil*, Khurra, *Dulhancee*. This is of a greyish white colour, with an earthy fracture, and a smooth greasy feel, it adheres to the tongue, and is very plastic, tenacious and infusible. When burnt it is of a cream colour, and is used for tobacco-pipes and white pottery. This is found in abundance in several parts of lower India and is used for nearly the same purposes that it is in Europe. The different castes of hindoos, too, employ it for making the distinguishing marks on their foreheads, and (moistened with water) it is often applied round the eye, in certain cases of ophthalmia, as well as to parts of the body that are bruised.

Asia The clays of Tenasserim have not been analyzed, but there are clays at the bases of some of the granite mountains, where the felspar has decomposed so much, that the paths are thick with a coarse quartzose sand and a few grains of mica that remain Porcelain clay is produced by the decomposition of felspar

6. *Five clays*, Sang-i-dalam, *Pers.*, are procurable at Streepermatoor, Tripasoor, Chingleput, Metapolham and Cuddapah Indeed are very common in many parts of India, and bricks can be made that resist the action of great heat A clay is found at Beypore, 20 to 30 feet below the surface, and is used for fire-bricks and for lining furnaces

7 *Unctuous clay* is excavated from a pit, near Kolat'h, in large quantities, and exported as an article of commerce, giving a royalty of Rs. 1500 yearly. It is used chiefly to free the skin and hair from impurities, and the Cutchi ladies are said to eat it to improve their complexions—*Tomlinson. Dis Mason and Hunter Tod's Rajasthan, Vol II, p 203*

CLEAN and UNCLEAN, terms often occurring in Scripture, Lev xi, 33, xii 2, has reference to unclean creatures, unclean persons and personal uncleanness As in that after childbirth, (in Lev xii. 2) a brahman mother is unclean for eleven days, a princess sixteen, merchant's wife seventy-one, and a Vellala Sudar thirty one days As with the Hebrew women, the hindoo mother who is in her days of uncleanness, cannot touch any hallowed thing nor any domestic article When the days of her purification are over, she takes or sends an offering to the temple In the matter of clean and unclean things and persons, the mahomedans follow the Mosaic law

CLEARING NUT. ENG Strychnos potatorum

CLEGHORN, Dr. Hugh. A medical officer of the Madras Army, a learned botanist, contributor to scientific journals of many articles on botanical subjects Conservator of forests at Madras. He wrote on the hedge plants of India, and the circumstances which adapt them for special purposes in particular localities (Rep Brit Ass. 1850) On the grass cloth of India. Ibid, 112 On the physical effects of the destruction of tropical forests, Ibid, 1851, London Athenæum, 1851, 781 Also on the Forests and Gardens of Southern India, and made a report in 1864, upon the forests of the Punjab and the Western Himalaya

CLEMATIDÆ The name is derived from Clema, a vine branch, from the climbing properties of the family. This tribe is acid and poisonous, the leaves and fresh stem, if

bruised and applied to the skin, cause vesication Roxburgh describes ten Himalayan species, and Voigt enumerates twelve Indian

cylindrica	florida	vo
gonriana	grata.	viticella

They are indigenous and exotic Griffith says there is one species, the virgin's bower, of this northern genus, in the Tenasserim Provinces, with simple fleshy leaves The *Clematis gouriana*, is abundant among the ruins of Gour, and it doubtless participates in the properties of the others. It forms, with *Porana paniculata* extensive lovely festoons. It is the *Morel*, the Indian Traveller's joy; is scandent, and perennial. It grows all over India, from Dindigul and the Neilgherries up to Deyra Dhoon, along the foot of the Himalaya Its flowers are white, at the close of the rains, and give out a very strong perfume, it is a hardy plant and grows in any soil The whole species are adapted for trellis work and easily increased by dividing the plants The colours are various, white, blue, lilac, yellow, &c. (*Riddell*) *Clematis grata* "Bihri" HIND. is a plant of Kaghan and Nepaul, and has small yellowish fragrant flowers, *C florida* is of Japan In France the *Clematis vitalba* is used by mendicants to cause artificial sores for the furtherance of their impostures In Cochinchina, according to Louriero, the *Clematis sinensis* is used as a diuretic and diaphoretic At the Mauritius, the *Clematis Mauritiana* is employed to blister the cheek for the relief of tooth-ache. *Clematis Wightiana*, W & A, is scandent, perennial with very soft villous leaves, coarsely serrated It, also, is called "*Morel*," and grows common at Mahableschwur, and the adjoining ghauts, flowering after the rains Wallich's *C grata* Asiatic PL t 98, much resembles it and is perhaps identical. Hedges and thickets where these plants grow have the appearance of being covered with hoar frost, from the white feathery tails of the seeds They are very ornamental and worthy of a place in gardens—*Gr Cat*, No. 2, p 1 *Riddell Mason Rox Flora* 2, p. 671 *Gr Cat* No 1, p 1

CLEOME, a genus of plants belonging to the Capparidaceæ or caper tribe Most of the species formerly placed under this genus have been transferred to the genera Polanisia and Gynandropsis Cleome monophylla, Linn., the *C. cordata* of D C, grows in Ceylon and the peninsula, and has small, pale, rose-coloured flowers—*Linn, Roxb in* 129, *D C.*

CLEVELAND, AUGUSTUS, a Bengal civil servant, who, in a brief space, won over the wild races near Rajmahal. He died while still young, and the Government of India decreed a monument to his memory with the following inscription. To the memory of Augustus Cleveland, Esq, late Collector of the districts of Bughulpore and Rajmahal, who, without bloodshed or the terrors of authority, employing only the means of conciliation, confidence and benevolence, attempted and accomplished the entire subjection of the lawless and savage inhabitants of the jungles of Rajmahal, who had long infested the neighbouring lands by their predatory incursions, inspired them with a taste for the arts of civilized life, and attached them to the British Government by a conquest over their minds, the most permanent, as the most rational mode of dominion. The Governor-General and Council of Bengal in honour of his character and for example to others, have ordered this monument to be erected. He departed this life on the 13th day of January 1784, aged 29.—*The Hind Vol I p. 101*

CLIMATE The hindu races of southern India, familiar only with the tropical countries in which they dwell, use "water" as the term for describing the effects of a climate on health. In this sense it is more the salubrity of a locality that is alluded to. Mahomedans of Asia treat of seven climates, the Haft aklim. This applies to the northern hemisphere, which they partition with zones of various breadth from east to west. When alluding to the salubrity of a locality, the mahomedans of India and Persia use the words Ab o-Howa, water and air. According to Simmonds (p 10) Meyen, in his division of the horizontal range of vegetation, into zones, extends,—

1 *The equatorial zone* to fifteen degrees on both sides of the equator. In this division are the Cape Verd Islands, Sierra Leone, Ascension and St Helena, the republic of Liberia, the European and native settlements in the Gulf of Guinea and on the Western Coast of Africa, Abyssinia, Zanzibar on the East Coast, Mocha and Aden in the Red Sea, the northern portion of Madagascar, the Seychelles, the Madras Presidency, Ceylon and the Nicobar Islands, Sumatra, Siam, Malacca, Singapore and the Straits Settlements, Cochin China, the Philippine Islands, Borneo, Celebes and the Moluccas, Java and Madura, Banca, the Johore Archipelago, Timor and the eastern group of Islands, with New Guinea, a large portion of Northern Australia, the Marquesas, Society and other Oceanic islands. In South America the Republics of Peru, Bolivia, Ecuador, New Granada, and Venezuela, British, French and Dutch Guiana, and a large portion of the empire of Brazil, Trinidad, Barbados, and most of the islands in the Caribbean Sea. This zone has a mean temperature of  $78\frac{1}{2}$  to  $82\frac{1}{2}$  Fahrenheit.

2 *The Tropical zone* reaches from the 15th degree on each side of the equator to the tropics in 23 lat. The mean temperature is  $73\frac{1}{2}$  to  $78\frac{3}{4}$  deg. Summer temperature  $80\frac{1}{2}$  to 86 deg. Winter temperature in the eastern coast districts 59 deg. In this region is comprised the following countries — Sandwich Isles, Canton, province of China, Burmah, Calcutta, and a portion of the Bengal Presidency, the Bombay Presidency, Madagascar, Mauritius and Bourbon, the southern portion of Brazil, Cuba, St Domingo, Mexico, and Central America.

3 *The sub-tropical zone* extends from the tropics 23 to 34 deg of latitude. There are a number of tropical fruits in this region. The winters are mild and vegetation is green throughout the year. In the northern division of the zone palms and bananas grow on the plains. In this region is comprised all the extreme northern portions of Africa, coasting the Mediterranean, comprising Algiers and the Barbary States, Egypt, part of Persia, Cabool, the Punjab and Hindustan, the greater portion of China, Lower California, Texas, the South-Western States of America, the Bermudas, the Cape Colony and Natal, New South Wales, Southern and Western Australia—the Government settlements in the Northern Island of New Zealand, the largest portion of Chile, Paraguay, Uruguay and the Argentine Republics, the Provinces of Brazil from St Paul to Rio Grande, Madeira and the Canary Isles.

Dr Royle gives the following arrangement

of the countries of which the plants will grow in the different parts of India

Tropical and East-Indian Islands, Tropical Africa, Brazil, Guiana, West Indies and Florida	Travancore, Cochin, Malabar, Ceylon, Malayan Peninsula, Chittagong, Bengal, Lower Assam
East and West Coast of Africa	Coromandel Coast, North and South Circars, Concan
Southern States of North America, Egypt, North of Africa, Syria	Gujerat, Behar, Doab, Delhi, Malwa,
Mexican Highlands, Lower Mountains of Spain	Mysore, Hilly ranges in Deccan, Rhyppootan
South of Africa, Extra Tropical New Holland, South America beyond 23° S Lat	Saharunpore and North-east Doab
Mediterranean Region	Dehra Doon, and Himalayan Valleys to moderate elevations
Chino-Japanese Region, Middle Andes, Peru, and Mountains of Brazil	Neilgherries, Upper Assam, Himalayan mountains
North of Europe, North of Asia, and North America	Himalayan Mountains, Regions of Oaks and Pines
Arctic regions, Mountains of Europe, Elevated Andes	Himalayas above Region of Forest

The northern, like the southern part of India, enjoys two crops during the year, one called the *khureef*, or rain crop, sown in June, and reaped in October, the other sown in October, and reaped in March and April, called the *ruboe*, or cold weather crop. The latter, embracing the months which approximate in temperature to that of the season of cultivation in colder countries, corresponds with them also in the nature of the plants cultivated, as for instance, wheat, barley, oats, and millet, peas, beans, vetch, tares, chick-pea, pigeon-pea, and lentils, tobacco, safflower, and succory, flax, and plants allied to mustard and rape, as oil seeds, carrot, coriander, and cummin, and other seeds of a similar kind, as *ajwain*, *sonf*, *soya*, *aneeson*. In the rainy season a totally different set of plants engages the agriculturist's attention, as rice, cotton, indigo, and maize, with sorghum, pulse, joai, koda, most of the tropical legumes, as well as several of the cucumber and gourd tribes, together with the sesamum, for oil, and the varieties of the egg plant, as a vegetable. The sun and sunnee, two cordage plants, are also cultivated at this season. In Hindustan the people usually arrange the year into three periods, the "Choumasa" or "Burk'ha," which is the rainy season, of four months duration, after which is the "Seela" or "Jain" or "Mohasa," the cold season, followed by the Dhoopkala or K'hur-sa or hot season. This division indicates, generally, the course of the seasons in India, though, in one locality, the rains or the hot or cold seasons, may be somewhat more pro-

longed. The primary divisions of continental India are four — Hindostan, including in which term the whole Peninsula of India, and the Gangetic plain, to the base of the Himalaya. 2 The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3 Eastern India ultra Gangem, including the kingdom of Ava and the Malay Peninsula. 4 Afghanistan. These divisions are marked out by great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceed 17,000 and 18,000 feet, and rise in isolated peaks or groups of peaks to 21,000 and to 28,000 feet.

From the western extremity of the Himalaya the Afghan mountains descend parallel with the Indus, with a gradually decreasing elevation from above 15,000 feet to the level of the sea at the Arabian gulf. Throughout Afghanistan the climate is excessive. The cold of the winter is intense, the spring is damp and raw, and the summer, during which hot, west winds prevail, is intensely hot at all elevations. The general aspect of the whole of Afghanistan is that of a desert. The crops are chiefly wheat and barley, even up to 10,000 feet elevation. Rice is cultivated in great quantity at Jellalabad 2,000 feet, at Kabul 6,400 feet, and to a considerable extent at Ghazni 7,730 feet. Poplars, willows and date-palm trees are extensively planted as well as mulberry, walnut, apricot, apple, pear, and peach trees, and also the *Elæagnus orientalis*, which bears an eatable fruit. The vine abounds as in all warm and dry temperate climates. The majority of the Afghan and Tibetan plants are also on the one hand natives respectively of the Caspian steppes and N Persia, and of Siberia on the other.

The date is cultivated in Beluchistan up to 4,500 feet, and a dwarf palm, *Chamærops Ritchieana* of Griffith, perhaps identical with the *Chamærops humilis* of Europe occurs abundantly in many places, but with a somewhat local distribution.

The Ava and Malayan mountains, being given off from the snow clad mountains of East-Tibet, run to the south, and, though rapidly diminishing in elevation, are continued almost to the equator.

The Aravalli mountains extend from Hansi and Delhi to Guzerat.

The Vindhya chain stretches across the centre of Hindustan, from the Gulf of Cambay to the Ganges, and is three to four thousand feet high.

A Peninsular chain also called the Ghats, and the Western Ghats extends from Cape

Comorin to the Tapti river, for upwards of 900 miles, running parallel to the coast line, and perpendicular to the direction of the monsoons. This chain divides the peninsula into two distinct climates of a narrow western one, in Malabar and the Concan, and a broad eastern one, in which are the Carnatic, Mysore, and the Dekkan, traversed by all the peninsular rivers.

The south-west monsoon comes from the southern ocean, and is loaded with vapour. It passes over the plains of Bengal, and strikes on the Khassia mountains, and the whole length of the Himalaya, discharging itself in heavy rains. From April till August it blows from the East of South, in August S S E, and in September more easterly, lowering the temperature of Bengal and of the northern plains, though the plains of the Punjab continue excessively heated.

From the vernal till the autumnal equinox, the heat of a great part of India continues great, but after the autumnal equinox, the great mass of the Himalaya becomes intensely cold, and the plains of India generally become cool. Where the north-east monsoon prevails, it is every where a land wind, except on the east coast of the Carnatic and in the Malayan Peninsula. In Malaya it blows over a great extent of sea, and is therefore very rainy, but at the Carnatic the width of sea is not great, so that the rain fall, though well marked, is less, and terminates long before the end of the monsoon, probably from the wind acquiring a more directly southerly direction, after the sun has reached the southern tropic. The amount of rain varies prodigiously in different parts of India, from almost none to six hundred inches, but the rain-fall affords no direct criterion of the humidity of any climate, for the atmosphere may be saturated with moisture without any precipitation taking place. Thus, while in Sikkim 1° for 300 feet is the proportion for elevations below 7,000 feet, on the Nilghiri Hills it is about 1° for 340 feet, in Khassia 1° for 380 feet, and the elevations of Nagpur and Umbala produce no perceptible diminution in their mean temperature, which is as great as that which would normally be assigned to them were they at the level of the sea.

At Mahabaleshwar it amounts to 248 inches annually. In the Southern Concan, especially in the Sawantwari district, the rains are as heavy as in Canara. At Bombay the rains last from June till the end of September, and the fall is only eighty inches, which is considerably less than at any point further south on the coast. At Tannah, however, the average fall is more than 100 inches. In the

Himalaya, the truly temperate vegetation supersedes the sub-tropical above 4,000 to 6,000 feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, humidity, and many local circumstances. In Ceylon and the Madras Peninsula, whose mountains attain 9,000 feet, and where considerable tracts are elevated above 6 to 8,000 feet, snow has never been known to fall. On the Khassia mountains, which attain 7,000 feet, and where a great extent of surface is above 5,000, snow seems to be unknown.

*Sikkim* occupies an intermediate position between Nepal and Bhotan, and unites the floras of Nepal, Bhootan, East Tibet, and the Khassia mountains, being hence, in a geographical and botanical point of view, one of the most important provinces in India, if not in all Asia. In Sikkim, snow annually falls at about 6,000 feet elevation, in Nepal at 5,000 feet, in Kumaon and Garhwal at 40,000, and in the extreme West Himalaya lower still.

That the mountain system of East Tibet is an enormously elevated mountain mass, is proved by the statements of many intelligent Tibetans, by the Chinese geographers, by the narrative of M. Hue, and by the fact of so many of the large rivers of Asia flowing from it in several directions. The Travancore group of mountains presents a striking analogy to the island of Ceylon. They are loftiest at the extreme north of the district, where they stretch east and west for sixty or seventy miles, separating the districts of Dindigul and Madura. Notwithstanding the perennial humidity, the rain fall at Courtalum is only 40 inches on the hills around, however, it is doubtless much greater. The Pulney or Palnai mountains west of Dindigul, the Anaimalaya south of Coimbatore, the Shevaghiri mountains south-west of Madura, and the ranges near Courtalum, are all well known. The remarkable palm, *Bentinckia*, so common on its mountains, is however not known in Ceylon. The other palms are *Caryota urens*, an *Areca*, *Phoenix faurieri*, and one or two species of *Calamus*.

To the north of Coimbatore the peninsular chain rises abruptly to 8,000 feet, as the Neilgherry range, and continues northward as the mountains of Coorg. The rain-fall, which is great on the western coast, is less on the Neilgherries, being 100 inches at Dodabetta and 64 inches at Ootacamund. Further north in the Nagai district of Mysore, there are many rounded or table topped hills 4-5,000 feet high, often cultivated to that height and

rising in some places to upwards of 6,000 feet. The climate of the western part is very humid and particularly so at the town of Nagai or Bednore, 4,000 feet high, on a spur of the western chain, where inclement rain is said to last for nine months. The Eastern Archipelago, from consisting of large islands, separated by belts of sea, possesses a humid and equable climate, but the great continent of Australia, being a vast expanse of low land, becomes enormously heated when the sun is in the southern hemisphere, and presents extremes of climate.

Intimately connected with climate is the mean annual temperature of different localities.

	Lat	Mean	Lat	Mean
Equator	0	82.5	Bombay	18 50 77.7

Sir J. Leslie has deduced from calculation that within the tropics, at the level of the sea, the thermometer ranges from  $84^{\circ}$  to  $76^{\circ}$ . Humboldt, from a very extensive generalization, estimated the mean temperature of tropical regions at  $81\frac{1}{2}$ . At Timcomalce the mean annual temp is  $80\frac{1}{2}^{\circ}$ . At London it is  $49.651$ . The thermometer sometimes rises higher in the tropics, in Arabia to  $110^{\circ}$  and during the night  $94$ .

Sir John Leslie calculates that the thermometer sinks  $1^{\circ}$  for every 100 yards of ascent within the tropics.

The mean number of rainy days are as under

	Rainy days	Rainy days
N L $12^{\circ}$ to $13^{\circ}$	78 $\frac{1}{2}$	N L $13^{\circ}$ to $46^{\circ}$ 103
$16^{\circ}$ to $50^{\circ}$	13 $\frac{1}{2}$	$51^{\circ}$ to $60^{\circ}$ 161

In China the staple summer crops are those which yield textile fibres. The jute of India, a species of *Cortellus*, is grown to a very large extent, and in China is used in the manufacture of sacks and bags for holding rice and other grains. A gigantic species of hemp (*Cannabis*) growing from ten to fifteen feet in height, is also a staple summer crop of China, and is used in making ropes and strings of various sizes, such articles being in great demand for tracking the boats up rivers and in the canals of the country. China grass-cloth, a beautiful fabric made in the Canton province, is largely exported to Europe and America. The *Urtica nivea* plant which is supposed to produce this, is abundantly grown in Kiangse and other provinces. Fabrics of various degrees of fineness are made from this fibre, but none are so fine as that made about Canton. It is also spun into a very strong and durable thread. There are two very distinct varieties of this plant

common in Chekiang—one the cultivated, the other the wild. The cultivated variety has larger leaves than the other, on the upper side, they are of lighter green, and on the under they are much more downy. The stems also are lighter in colour, and the whole plant has a silky feel about it which the wild one wants. The wild variety grows plentifully on sloping banks on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure than the other kind. The cultivated kind yields three crops a year. A species of juncus is grown, the stems of which are woven into beautiful mats, used by the natives for sleeping upon, for covering the floors of rooms, and for many other useful purposes. This is cultivated in water somewhat like the rice plant, and is therefore always planted in the lowest part of the valleys, in the beginning of July the harvest of this crop commences. At grey dawn of morning

the sheaves or bundles were taken out of temporary sheds, erected for the purpose of keeping off the rain and dew and shaken thinly over the surface of the ground. In the afternoon, before the sun had sunk very low in the horizon, it was gathered up again into sheaves and placed under cover for the night. And so the process of winnowing went on day by day, until the whole of the moisture was dried out of the seeds. The winter crops of that part of China consist of wheat, barley, the cabbage oil-plant, and many other kinds of vegetables on a smaller scale. Large tracts of land are planted with the bulbs of a liliaceous plant, probably a *Fritillaria*, which are used in medicine. This is planted in November and dug up again in April and May. In March these lily fields are in full blossom, and give quite a feature to the country. The flowers are of a dingy greyish white and not very ornamental.—*Fortune, Res. among the Chinese*, page 259. *Simmond's Commercial Products*. *Royle on the Productive Resources of India*. *Hooker and Thomson Fl. Indica*.

**CLIMBERS** Climbing plants are exceedingly numerous in the damp forests of India. At Tunglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scandent trees twisting around the trunks of others, and strangling them. The latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups—(1) Those whose stems merely twine, and by constricting certain parts of their support, induce death. (2) Those which form a net-work round the trunk, by the coalescence of their lateral branches and aerial roots, &c. these wholly envelope and often conceal the tree they enclose, whose branches appearing far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are *Leguminosæ*, *vines*, *hydrangea*, *vines*, *Pothos*, &c. The musculation ones are almost all figs and *Wrightia*, the latter is the most remarkable for its grasping roots.—*Hooker Him. Journ.*, Vol. 1, page 163, 164.

There are several varieties of this cultivated flowering plant, and the most common are the blue and white. They blossom all the year round and being shrubby twining plants, are well suited for covering trellis work. They are of easy growth, and the blue flowers are used sometimes for colouring boiled rice. Are propagated by seed, and in any soil. In some parts of Southern Asia, it is a common wild creeper during the rains. Dr J. D. Hooker mentions that a beautiful blue-flowered *Clitoria* creeps over the path to Syong on the Khassia Hills, with the ground raspberry of Darjiling. In Tenasserim, the *Clitoria ternatea*, with its deep blue flowers, is seen tangled with other climbers, wandering over trees and arbors, in all parts of the country. Dr. Ainslie informs us that the sweetish, somewhat warm, white root of this plant is given in substance ground into powder in croup cases, that it sickens and sometimes vomits, the dose being half a pagoda weight for a child of two or three years. Dr. O'Shaughnessy used the root extensively in order to test its alleged emetic effects, but never observed the occurrence, an alcoholic extract acts however as a brisk purgative in from 5 to 10 grain doses. But griping and tenesmus are often produced, and during the operation of the medicine the patient is feverish and uneasy. He does not recommend its use. Its flower is held to be sacred to Durga.—*Riddell Him. Journ.* Vol. II, page 291. *Mason O'Shaughnessy*, page 315. See *Kaukarkartam* var.

**CLIVE**, Robert Lord, a Madras civil servant, who became a great military commander, was Governor of Madras, and Governor General of India. Amongst the many eminent men who have served and ruled in British India, he alone has been styled "Great," and whether his deeds as a military commander be considered, or his successes in the civil administration of India, posterity has conceded that title to him alone. He entered the service of the E. I. Co. in 1744, but shortly afterwards obtained an ensign's commission. In September 1748, he distinguished himself as an ensign before Pondicherry, and again in August 1749 at Devi-

Cottah In May 1751 he was present in the fight at Voleondah, and in July defeated the French at Condore In 1751 he laid siege to Arcot, with only 120 Europeans and 200 natives, in August, took it, in November he defeated Basim Rao at Arni, in December took the pagoda of Conjeveram, in 1752 he defeated the French and Chandah Sahib at Cauverypauk, destroyed the town of Duplex Fatchabad, defeated the French army, took Covelong, and commanded the land forces against Ghemah Clive, in 1756, after the fall of Calcutta and the imprisonment by Suraj-ud-Dowlah, left Madras with 900 Europeans, recaptured Calcutta, and made peace But war again broke out, and Clive with 3000 British and native soldiers defeated Suraj-ud-Dowlah on the 23rd June 1757 at Plassey, 40 miles south of Moorshedabad Mir Jaffir was then declared subadar of Bengal, Behar and Orissa Clive revisited Britain in 1760 with the rank of Colonel Mir Jaffir Khan was restored in 1763 Clive subsequently returned to India, corrected abuses in the Government, obtained the Dewani of Bengal, Behar and Orissa, and assumed the civil and military government of the country His retrenchments caused a mutiny amongst the officers and men, which he quelled with severe measures He returned to Britain in 1767, and at first was well received, but was subsequently impeached before parliament, and only escaped by death He died in November 1774 In his final treatment by his country his fate resembled that of La Bourdonnais and Duplex Lord Clive's life has had several historians, amongst whom are Caraccioli and Malcolm — *Malletson Ome*

Clive, Lord, Governor of Madras, in 1801 The descendant of Lord Clive is now styled Earl Powys in the Peerage of Great Britain

The clocks to be seen in the south and east of Asia are wholly of European manufacture Prior to their introduction, the clepsydra or water clock was in general use, these were of copper, with a small aperture at the bottom, through which, when placed in water, the clepsydra filled and sank, the sinking marking an hour The water clock of the Malay sailors is half of a cocoanut-

shell with a small hole, through which, when placed in a bucket, it fills and sinks in an hour The clocks and watches of Europe are now largely distributed in all parts of Asia —

CLOSE, Sir Barry, a distinguished military commander in the south of India after the time of Clive

CLOTHING The materials used for clothing, and the forms of dress of the people of the south and the east of Asia, all differ widely according to the climate, the pursuits, and the origin of the races, for, through a thousand years, seemingly, the Eastern races continue to wear clothing similar to what their forefathers put on and in the countries embraced in this work, are human beings who, like the Andamanese, live wholly without apparel, and others, like the Chinese, who dress in a very elaborate manner Hindoo men and women, until recently, wore only cloths, without seams, and even yet, perhaps, the woman's boddice (choli) and the man's jacket (angika) alone are sewed, the lower garment of both sexes being long cloths which are skilfully wrapped round the limbs, and often as neatly so as sewn trousers The Rajput nobles, as also indeed most hindus, wear trousers when on horseback, but the prevailing hindu custom illustrates Mark 50, where mention is made of the blind man throwing off his upper garment, which was doubtless a piece of cloth It is not considered at all indecate among this people for a man to appear naked from the head to the waist, and servants thus attend at the tables of poor Europeans In Arabia, a coarse cloak of camel or goat's hair is generally worn It is called an Abba, and the material camalcen Amongst men of the very humblest classes of Southern India, the simple loin cloth is the sole body clothing, but almost all have a sheet, or a cumby, or coarse blanket of wool or hair as a covering for warmth The Nan women move about with the body uncovered down to the waist, they do so to indicate the correctness of their conduct, the women of the Chensuai, a forest tribe in the neighbourhood of Ganjam, wear a covering of a bunch of leaves hanging from the waist both in front and behind, but, throughout British India, every other woman, however humble in circumstances, whether hindu or mahomedan, is wholly covered from the neck to the ankles, with choli and gown or cloths of kinds This seems to have been the case from remote times In the play 'Mrichchakati,'

attributed to king Sudraka of Ujjein who reigned, according to the traditional chronology, in the first century before the Christian era, and is certainly not later than the second century after Christ, we find the following passage Act iv sc ii —

*Martena* Pray, who is that gentleman dressed in silk raiment, glittering with rich ornaments, and rolling about as if his limbs were out of joint?

*Attendant* That is my lady's brother

*Martena* And pray who is that lady dressed in flowered muslin? a goodly person truly, &c'

The following passage, taken from the 'Ut-tara Rama Cheritra,' by the same author, affords an idea of the costume of a warrior race Janaka, the father of Sita, the heroine, in describing the hero Rama, says—

'You have rightly judged

His birth for see, on either shoulder hangs  
The mutual quiver, and the feathery shafts  
Blend with his curling locks Below his breast,  
Slight tintured with the sacrificial ashes,  
The deerskin wraps his body, with the zone  
Of Murva bound, the madder tinted-garb  
Descending vests his limbs, the sacred rosary  
Begirds his wrists, and in one hand he bears  
The Pippal staff, the other grasps the bow  
Arundati, Whence comes he?

The women of Burmah wear a neat boddice, and a cloth as an under garment wrapped tightly round the limbs from the waist downwards but it is so narrow that it opens at every step and all the inner thigh is seen For the masses of the people of India and the East, the English manufacturer sends plain and striped "dooia," "mulmul," "aghabani," and other figured fabrics, which have established themselves there, and which, both from their good quality and moderation in price, are acceptable to the numerous classes who make use of them the manufacture of the finest qualities of muslins, whether produced at Dacca or in Europe, must necessarily be always of a very limited character, and then use confined to very rich purchasers

Long cloths or punjums of various qualities were formerly manufactured to a great extent in the Northern Circars, as well as in other parts, the great proportion consisted of 14 punjum or cloths, containing fourteen times 12 threads in the breadth, which varied according to local custom from 38 to 44 inches 14lb was considered the proper weight of such cloths, the length 36 cubits, half lengths being exported under the denomination of salampoies The manufacture of the finer cloths which went up to and even exceeded 50 punjum, has long been discontinued

*Long-Cloths* —Very superior kinds of long-cloths were formerly manufactured at Vizaga-

patam and sold at from 70 to 350 Rs each, but the large supplies of long cloths from Great Britain, selling at the more moderate prices of from 6 to 40 Rs per piece, has quite destroyed that old Indian manufacture

*Cloths, Men's* —These cloths are manufactured all over the country, but those of the Madras District have lace borders they are sold as high as 70 Rs for a suit of two pieces Conjeveiam is noted for its silk bordered cloths, which are sold for not more than 15 Rupees a pair.

*Cloths, Native Female, Cotton.* —This description of cloths forms an article of manufacture in every district, and are in constant use by all classes of the country Madras manufactures a nicely coloured woman's cloth called "oolloo sailay," sold for seven rupees and upwards Arnee is noted for its manufacture of a superior quality of white cotton cloths of various patterns Those of Sydapet, in Chingleput, a country town in the outskirts of Madras, are of ordinary quality and of different colours. Ganjam also fabricates a common sort, with a few of more value, worked with lace borders but not sold for more than 50 Rs

*Cloths, Native Female, Silk* —The principal places for the manufacture of native female silk cloths are the towns of Benares, Berhampore, and Tanjore Those of Benares are generally of superior quality with rich lace borders, and they are sold at from Rupees 50 to 350 or upwards Berhampore cloths are wholly silk but nicely finished Tanjore cloths are also neatly finished with nicely worked borders, both of lace and silk of various colours they are sold at from Rupees 15 to 150

*Cloth, Silk, called Pethambaram* —These are chiefly brought from Benares and Nagpore they are also made at the town of Combaconum The Benares cloths are highly prized for their superior quality they measure 12 by 2½ cubits a piece two pieces make one suit of an upper and under garment Hindoos wear these cloths during their devotions and holiday time. They are sold from Rupees 50 to 350 or even more The silk fabrics of Combaconum are good, although not equal to those of Benares

*Cloths, White,* were manufactured all over Southern India, but those of Manamadoo in the district of Trichinopoly were very superior in quality and used by the more respectable of the inhabitants as clothing under the name of "Manamadoo Sullah" That at Arnee in the district of Chingleput, known as "Arnee Sullah," is of different quality

*Cloth, Woman, Cotton, Coloured* —These colored cotton cloths are largely made in the Madura district. They are of various sizes,

with or without lace worked borders. Those with lace vary in price from Rupees 15 to 200 each, they are generally purchased by respectable natives, by whom they are highly prized. These fabrics are known in the market as —

Varkay, Lace bordered	Joonnady, Lace bordered
Thomboo do do	Ambooresa, do do

*Cloth, Woman's Silk* — These are brought chiefly from Benares and Nagpore, but they are fabricated also at Berhampore, Tanjore, Combaconum, and Conjeerain, in the Madras Presidency. Those of Benares and of the Malabar countries are celebrated for their superiority, and are highly prized for their lace borders. Their size is 16 by 2½ cubits, and they are sold at Rupees 50 to Rupees 300 and upwards, those made at Berhampore, Tanjore, and Combaconum are not equal to the Benares cloths, but are well made and sold at from Rupees 15 to 70 each. The woman's cloths of Tanjore and Madura manufacture, and men's head-cloth, also from Madura are good articles, and will compete with the production of any other loom in the world.

*Printed cloths* are worn occasionally, as in Berar and Bundelkhand, for sarees, and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the humbler classes in Upper India, but the greatest demand for printed cloths is for palampores, or single quilts.

In the costlier garments woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the sarees, or women's cloths,—those made at Benares, Pytun, and Boorhanpoor, in Guzerat, at Nurrampett, and Dhanwarum, in the territory of His Highness the Nizam, at Yeokla in Khandesh, and in other localities,—have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, cheeks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey, and in silk, black shot with crimson or yellow, crimson, with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country, for an Indian lady who can afford to be choicer in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair,—as any lady of Britain or France. Another exquisitely beautiful article of Indian costume for men and women is the doputta scarf, worn more frequently by

mahomedan women than hindu, and by the latter only when they have adopted the mahomedan lungi, or petticoat, but invariably by men in dress costume. By women, this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head, by men across the chest only. Doputtas, especially those of Benares, are perhaps the most exquisitely beautiful of all the ornamental fabrics of India, and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns of the ribbon borders or broad stripes. How such articles are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colours, the creamy white, and shades of pink, yellow, green, mauve, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours—black, scarlet, and crimson, chocolate, dark green, and madder, but, whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing, but the dyers and seomers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The doputtas of Pytun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Deccan, not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares. Scarfs are in use by every one, plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called 'sehla' in India, are in every day use among millions of hindus and mahomedans, men and women. They are always open textured muslins, and

the quality ranges from very ordinary yarn to that of the finest Dacca fibres. The texture of the dhotees, sarees and langhies manufactured in Britain and sent to India, is not that required by the people, nor what they are accustomed to. It is in general too close, too much like calico in fact, which, of course, makes the garment hot, heavy in wear, and difficult to wash. Again, the surface becomes rough, and, as it is generally called, 'fuzzy' in use, while the native fabric remains free. Comparatively few native women of any class or degree wear white, if they do wear it, the dress has broad borders and ends. But all classes wear coloured clothes, black, red, blue, occasionally orange and green, violet, and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Nairampett, Dhanwar, and Muktal, in the Nizam's territories, Gudduk and Bettigerry in Dharwar, Kolapoor, Nassik, Yeola, and many other manufacturing towns in the Deccan, Arnee in the south, and elsewhere, send out articles of excellent texture, with beautifully arranged colours and patterns, both in stripes and checks. The costly and superb fabrics of cloths of gold and silver (Kimkhab), and the classes of washing satins (Mushroo and Hemroo), even if European skill could imitate them by the hand-loom, it would be impossible to obtain the gold and silver thread unless it were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful delicate manipulation. The gold and silver cloths, (kimkhab), are used for state dresses and trousers, the latter by men and women, and ladies of rank usually possess petticoats or skirts of these gorgeous fabrics. Mushroo and Hemroo are not used for tunics, but for men's and women's trousers, and women's skirts, as also for covering bedding and pillows, they are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used, but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. For example, a labada or dressing gown made of scarlet mushroo in 1842, has been washed over and over again, and subjected to all kinds of rough usage, yet the satin is still unfrayed, and the colour and gloss as bright as ever. Many of the borders of loongees, dhotees, and sarees are like plain silk ribbons, in some instances corded or ribbed, in others flat. The Saree, Boonee, Bafta, Jore,

Ekpatta, Gomcha, &c, of Dacca, are now entirely made of imported British yarn. Fabrics of a mixed texture of cotton and silk, are, in Dacca, designated by various names, as Nowbuttee, Kutun, Roomie Apjoola and Lucka, and when embroidered with the needle, as many of them frequently are, they are called Kusheeda. The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet, but the cotton thread employed is now almost entirely British yarn, of qualities varying from Nos 30 to 80. These cloths are made exclusively for the Jedda and Bussora markets, and a considerable stock is yearly imported in the Arab vessels that trade between Calcutta and these ports. Pilgrims too, from the vicinity of Dacca, not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meen, near Mecca. They are used by the Arabs chiefly for turbans and gowns. The golden colour of the muga silk gives to some of these cloths a rich lustrous appearance. Pieces made of native spun cotton threads and of the best kind of muga silk, are admired. The export-trade of the Madras Presidency in madapollams and long cloths has been annihilated by the goods laid down by the British manufacturer, in all the bazars of India.

*Buchhane* in Dharwar, is commonly worn as a waist cloth by children of respectable people, also worn by adults of the same class, while sleeping. Price one rupee two annas.

*Chanduse*, a cotton scarf, coloured border and ends, used in Khyrpoor.

*Cholee* or Boddice, an under-jacket worn by women. The Thāns, or cholee pieces of Dharwar, of a description used by women working in the fields, cost three annas for each cholee or twelve annas the piece.

*Punchrungee* of Dharwar has a warp of silk and weft of cotton, worn ordinarily by dancing women, not considered fit for respectable women, one "thān," one rupee twelve annas.

*Cummar bunds* are sashes worn by men. They are of cotton and of silk.

*Dhotees* are waist and loin cloths, and are occasionally worn so as to fall over and cover the greater portion of the lower limbs. One of a coarse cotton commonly worn by cultivators and laborers in the field may cost about two rupees.

*Izar bund* is of silk or cotton, and is a tie for trousers.

*Khess*, a chintz scarf in use in Hyderabad (Sind)

*Loongi* or scarfs of cotton, of silk, and of silk and cotton, are worn by men.

*Moondasa*, a cloth worn by the poorer classes in Dharwar Costs rupees one and a quarter.

*Mundel*, a cloth of cotton and gold, obtainable in Kutch Costs Rs 8-4-11

*Paranda*, a silk material used as a hair ornament in Lahore

*Patso* of Burmaah, is a cloth worn by all classes In Akyab it is called *Patsan* and *Patso*, and is worn there by the Mug race

*Punjee* of Dharwar, is a cloth used by well-to-do people, to dry themselves after bathing, and also worn as a waist cloth by poor people Price one rupee

*Salendong*, a silk scarf of Singapore

*Salimote*, a silk scarf of Singapore

*Saree* is the name of a hindu woman's lower cloth, and they vary in price from rupees two and upwards Each woman generally has a new one once a year It is often used also as an upper garment, in the form of a scarf, for enveloping the person, one end being usually brought over head as a covering

*Selya* in the south of India, is a sheet or body covering in use amongst the poorer classes, cultivators, laborers, wrapped round then shoulders and body when employed in the fields Their usual cost is about rupees one and a quarter to rupees one and three quarters In Dharwar one is always presented to the bridegroom by relations of the bride, together with a turban — *Dis Taylor and Watson, Ex of 1862*

CLOVE PINK *Dianthus caryophyllus*

CLOVER, or trefoil, a name given to several species of the genus *Trifolium* grown in Europe They are not grown in India The most valuable grass in Tenasserim is not a proper grass, but, like the English clover, is a leguminous plant. It is a species of *hedysarum*, which, in India, says Dr Wight, supplies the place of the species of *Trifolium* and *Medicago* in Europe In other words, the farmer finds it a good substitute for clover

and lucerne, and there is another leguminous plant at Tavoy, *Smithia sensitiva*, which is said to make excellent hay.

In a law passed by Ameliam the first, in A D 175 and 180, cloves are mentioned The cloves of commerce are the unopened flowers, the flower buds of the clove-tree, *Caryophyllus aromaticus* (*Eugenia caryophyllata*), which was originally a native of the Moluccas, but is now cultivated in Penang, Sumatra, Bourbon, Zanzibar, Guiana and the West India islands They have the form of a nail, and when examined are seen to consist of the tubular calyx with a roundish projection, formed by the unopened petals It is a very handsome tree growing to the height of twenty to forty feet The trunk is straight, and rises four or five feet before it throws out branches The bark is smooth, thin, of a grey color, and the wood of the trunk too hard for ordinary cabinet work The leaves are opposite, smooth, narrow pointed, of a rufous color above, and green on the under side They have a very aromatic odor when bruised between the fingers The flowers produced in branched peduncles, at the extremity of the bough, are of a delicate peach color The elongated calyx, forming the seed vessel, first changes to yellow, and, when ripe, to red, which is from October to December, and in this state it is fit to gather If left for a few weeks longer on the trees, they expand, and become what are termed "mother cloves," fit only for seed or for candying In the gathering, the ground under the tree is first swept clean, or else a mat or cloth is spread The nearest clusters are taken off with the hand, and the more distant by the aid of crooked sticks Great care is taken not to injure the tree, as it would prevent further bearing The cloves are then prepared for shipment by smoking them on hurdles near a slow wood fire, to give them a brown color, after which they are further dried in the sun They may then be cut off from the flower branches with the nails, and will be found to be purple colored within, and fit to

be baled for the European market. In some places they are scalded in hot water before being smoked, but this is not common. The tree begins to bear from the seventh to the fifteenth year, and is fruitful till it is 75 or 150 years old. The annual yield of a good tree is about lbs 4½, and the annual crop from Amboyna, Hainu, Saparna and Nasalaut is lbs 3,50,000 of Amsterdam (*Bulmore*, 154.) Mr. Crawford tells us that the clove is remarkable for its limited geographical distribution. It is only in its native localities, the five small islets on the western coast of the large island of Gilolo, that it is easily grown, and attains the highest perfection. There it bears in its seventh or eighth year, and lives to the age of 130 or 150. Rumphius informs us, that shortly before the arrival of the Portuguese it had been carried to and reared in Amboyna, where, however, it does not bear until its fifteenth year, and where the average duration of its life does not exceed 75 years. He informs us further that large islands are not favourable to its growth—that it succeeds indifferently even in such islands as Gilolo and Ceram, and that the natives of Celebes and Java, who had attempted to grow it in their own country, had obtained plants which bore no fruit. Europeans, however, have succeeded somewhat better. The clove has been long transferred by them from the Moluccas to Sumatra,—to the islands in the Straits of Malacca,—to Bourbon, to Zanzibar, on the eastern coast of Africa, and to Cayenne. In some of these places, however, the culture has virtually failed, even where that of the nutmeg has succeeded, and everywhere the produce is of inferior quality to that even of Amboyna. A suitable soil seems to be as indispensable as a suitable climate. The soil of the Molucca Islands is volcanic, which is not the case with any of the countries to which the tree has been transferred, except the Island of Bourbon, and here the suitable climate seems to be wanting. The clove appears, from Pigafetta's statement, to have been private property, and entirely free in culture and trade, Malays, Javanese, Chinese, Macassars, and Arabs, all competing for it in an open market. The annual quantity produced, according to him, in the five islands, seems to have been from 1500 to 2000 bahars, and the bahar is an Arabian weight, computed in the Moluccas at about 590 pounds. The companions of Magellan themselves loaded two ships with cloves at the single island of Tidore, after a stay, from their arrival to their departure, of no more than forty-four days. The Portuguese made their first appearance in the parent country of cloves in the year 1512, and having been expelled

by the Dutch in 1605, they had the principal share of the clove trade for ninety-three years, a period of rapine, violence, and bigotry. Their main object was the exclusive monopoly of spices, by the expulsion of all rivals. Their successors pursued the same object in a manner still more rigorous. They extirpated the clove trees in their native islands, and endeavoured to limit their growth to the five Amboyna islands, in which the clove is an exotic. Periodical expeditions for the extirpation of young plants that might spontaneously have sprung up, or been propagated by birds, formed part of this system. The clove monopoly still exists, but in a very tottering condition. The periodical exterminating expeditions have been merely nominal during the nineteenth century, and since the year 1820, although the monopoly be persevered in, in the five Amboyna islands, where the parks, as they are called, are the property of the government, the culture and trade are legitimate everywhere else—(*Crawford's Dictionary*, page 104.) The clove tree may be seen in a few gardens on the Tenasserim coast, and cloves are abundant in the bazars. At the Madras Exhibition of 1855, cloves were forwarded from Travancore, Tinnevely, Canara, and Cochin. The plumpest and heaviest were from General Cullen's Gardens near Oodagherry, 1800 feet above the sea, these had a strong aromatic odour, and were of a dark brown colour; they were quite entire, and when pressed with the nail, the oil exuded. The specimens from S. Warriar, Dewan of Cochin, and those from the Tinnevely district, were almost equally good—*M. E. J. R. Bickmore Archip* 115 *Simmon's Comm Prod* *Crawford's Dictionary* *McCulloch's Commercial Dictionary* p. 211. See *Caryophyllus aromaticus*. *Eugenia caryophyllifolium* Myrtaceæ.

## CLOVE TREE,

A native of the Moluccas, introduced into Amboyna, Ternate, Sumatra, Malacca, Penang, Tenasserim, Tinnevely, Travancore, Canara, Cochin. See *Caryophyllus aromaticus*, Cloves.

CLUB MOSS *Lecopodium* See Feins

CLUB-WOOD of Tahiti, *Casuarina muricata*

CLUPEA, a genus of fishes belonging to the group Clupeina and family Clupeidæ. There are 61 recognized species and 26 doubtful species, they inhabit every part of the globe, and several of them are found in the south and east of Asia. A species of Clupea in Ceylon is called the poisonous sprat.

CLUPEA PILCHARDUS, the Pilchard, frequents the coast of Japan in the latter part of the month of June and commencement of July. They are taken by the seine

nets. When fresh, they are sweet and nutritious, but they are chiefly valued for their oil, to obtain which they are piled up in heaps for 24 hours, are then boiled for some time in sufficient water to prevent their burning, then ladled into strong square presses, and the lever action of a lid presses out the oil. The oil after cleaning is used for lamps and the refuse for manure.

**CLUPEIDÆ** A family of fishes of the order Physostomi. The *Clupeidæ* are placed by Cuvier between the *Salmonidæ* and the *Gadridæ* and they form the fifth and last division of his section 'Malacopterygiens Abdominaux'.

The family contains the following 18 Genera

Cetengraulis	2 Species	Pristigaster	7 Species
Engraulis	37	Chirocentron	1
Coilia	10	Spiatelloides	3
Chatoessus	10	Dussumiera	2
Clupea	61	Etruneus	2

Pellonula	1	Elops	2
Clupeichthys	1	Megilops	2
Pellona	14	Chanos	2

**CLUPEONIA PERFORATA**, CANTOP, inhabits the seas of Penang, Malayan Peninsula, Singapore, Sumatra. Total length  $5\frac{3}{4}$  inch. They are of delicate flavour and pass in the settlements of the Straits under the denomination of 'Sardines,' in imitation of which they are sometimes preserved in oil. A resemblance to *Alausa argyrochloris*, Cuv et Val (Vol XX p 440) is further increased by the impossibility of perceiving the teeth, either in the fresh state or in specimens preserved in spirits of wine. They require the aid of a lens to be distinguished in the skeleton. The general form, the yellow dorsal fin with a small black spot, give the present species a certain resemblance to *Meletta venenosa* Cuv et Val (vol XX p 377). Some specimens of *Clupeonia perforata*, procured by W T Lewis, Esq, Assist Resid Councillor, Penang, were accompanied by the following account of a phenomenon witnessed by that gentleman during his official residence at Bencoolen. In 1822, great numbers of what was supposed to be this identical species, presented the unusual appearance of having red eyes. Many natives, after having eaten these fishes, were suddenly attacked with violent vomiting, which, in cases where remedies were not immediately applied, was known within an hour to terminate fatally. At the same time, such of these fishes with the ordinary silvery eyes, were, as formerly, eaten with impunity. This phenomenon recurred at Bencoolen during the seasons of 1823 and 1825, but not of 1824. It was surmised that the poisonous fishes had fed on a gela-

tinuous substance which at that season exudes from the beautifully coloured coral reefs on that part of the coast of Sumatra. It is, however, more probable that the poisonous fishes were shoals of *Meletta venenosa*, an inhabitant of the Seychelles and the neighbouring seas, which happened in those seasons to visit Sumatra. M Valenciennes describes this fish as being poisonous, and producing effects as noted above. In the Straits of Malacca *Clupeonia perforata* has never been known to produce bad effects.—Cantor.

**CLUSIA**, a genus of plants belonging to the natural order *Clusiaceæ* or *Guttifera* of Lindley, named after Charles de l'Ecluse, or Clusius, one of the most celebrated botanists of the 16th century. The genera of this order are now generally referred to the *Garciniaceæ*—*Engl Cyc Vol II p 4*.

**CLUSIACEÆ**, one of the orders of plants according to the natural system of Lindley. The genera of this order, *Garcinia*, *Mammea*, *Mesua*, *Calophyllum* and *Kayea* are now usually arranged under *Garciniaceæ*.

**CLUYTIA**, a genus of plants belonging to the natural order *Euphorbiaceæ*.

**CLYDE**, Colin, Lord, longer known as Sir Colin Campbell, whom Sir William Napier styled the war-bred Sir Colin. He was a military officer of the British Army, and commenced his career as a volunteer with the 9th Regiment of Infantry in the British Army, which he accompanied to Portugal. He afterwards served in Holland at the disastrous expedition to Wilcheren, and again in the Peninsula under Sir John Moore, and he was present at Vimiera, Corunna, Bussora, Vittoria, and San Sebastian, at the siege of which he led the storming party where he was again severely wounded, having been previously wounded at the passage of the Bidassoa. He was in the expedition of 1814 and 1815 to America. In 1812 he served in the war of China. In 1818 and 1819, in the Punjab campaign and at the passage of the Chumb, at Chillianwallah and Guzerat. He was engaged against the hill tribes up to 1852. In the war in the Crimea he commanded the Highland Brigade, and to him was due the success of Alma, and he preserved Balaklava against an attack of the Russian forces. The triumphal termination of his long career of war however was in India, to which he was sent in 1857, when the Bengal native army revolted, and much of Northern India was in rebellion. He gathered troops about him until he could advance, and he did so without a single check. He died at Woolwich at the close of the Mutiny. See Battles of India, British India.

**CLYPEA GLABRA** W & A

*Cissampelos glabra* *Roxb.* | *Cocculus Roxburghianus* *D C*

A native of Silhet, root large, acrid, and used medicinally.

Coal differs considerably in its physical properties, and its varieties have obtained various names in the markets. The mineralogist generally divides it into coal without bitumen, and coal with bitumen. The first variety is known by the general name of *Anthracite*. It is sometimes very hard, has a high lustre, and is often indurated. It is used for fuel, but it is often made into small stakands, boxes, and other articles of use. This is more especially the case with the anthracite of America. Anthracite is the most common form of coal in the Welsh beds.

The bituminous varieties of coal present greater differences of structure and appearance, and have a larger number of names, the quantity of bitumen, or substances resembling it, differ very much in different specimens of coal. It is generally softer and less lustrous than anthracite, although occasionally specimens exhibit a very brilliant fracture. Its specific gravity is less than that of anthracite, seldom exceeding 1.5, whilst the specific gravity of anthracite ranges from 1.3 to 1.75. The kinds of this coal are known by various names. The following are analyses of the different kinds of coal which occur in the Newcastle beds.

	Splint Coal	Cal ing Coal No 1	Cal ing Coal No 2	Cherry Coal
Density	1.302	1.417	1.280	1.206
Carbon,	71.961	63.585	87.809	84.694
Hydrogen,	6.254	5.100	5.109	5.064
Nitrogen and Oxygen,	1.873	8.743	5.139	8.476
Ash,	11.912	2.591	1.393	1.576
Relative heat by the unit weight of Coal	110.310	111.980	122.560	116.630
Relative heat by the same volume of Coal,	105.90	111.310	119.030	112.070

*Pitching or Caking Coal* has a velvet or grayish black colour. When first thrown on a fire it breaks into small pieces, but on the continued application of heat, the pieces again unite into a solid mass or cake. It burns readily with a yellow flame, but on

nets. When fresh, they are sweet and nutritious, but they are chiefly valued for their oil, to obtain which they are piled up in heaps for 24 hours, are then boiled for some time in sufficient water to prevent their burning, then ladled into strong square presses, and the lever action of a lid presses out the oil. The oil after cleaning is used for lamps and the refuse for manure.

He was engaged against the hill-tribes up to 1852. In the war in the Crimea he commanded the Highland Brigade, and to him was due the success of Alma, and he preserved Balaklava against an attack of the Russian forces. The triumphal termination of his long career of war however was in India, to which he was sent in 1857, when the Bengal native army revolted, and much of Northern India was in rebellion. He gathered troops about him until he could advance, and he did so without a single check. He died at Woolwich at the close of the Mutiny. See Battles of India, British India.

Coal differs considerably in its physical properties, and its varieties have obtained various names in the markets. The mineralogist generally divides it into coal without bitumen, and coal with bitumen. The first variety is known by the general name of *Anthracite*. It is sometimes very hard, has a high lustre, and is often indurated. It is used for fuel, but it is often made into small inkstands, boxes, and other articles of use. This is more especially the case with the anthracite of America. Anthracite is the most common form of coal in the Welch beds.

The bituminous varieties of coal present greater differences of structure and appearance, and have a larger number of names, the quantity of bitumen, or substances resembling it, differ very much in different specimens of coal. It is generally softer and less lustrous than anthracite, although occasionally specimens exhibit a very brilliant fracture. Its specific gravity is less than that of anthracite, seldom exceeding 1.5, whilst the specific gravity of anthracite ranges from 1.3 to 1.75. The kinds of this coal are known by various names. The following are analyses of the different kinds of coal which occur in the Newcastle beds—

	Splint Coal	Caking Coal No 1	Caking Coal No 2	Cherry Coal
Density	1.302	1.247	1.280	1.206
Carbon	71.961	83.588	87.809	84.694
Hydrogen	6.254	5.130	5.159	5.054
Nitrogen and Oxygen	4.873	8.743	5.139	8.476
Ash	13.912	2.591	1.393	1.576
Relative heat by the same weight of Coal,	110.340	114.980	122.560	116.630
Relative heat by the same volume of Coal,	108.90	111.310	119.030	112.070

*Pitching or Caking Coal* has a velvet or grayish-black colour. When first thrown on a fire it breaks into small pieces, but on the continued application of heat, the pieces again unite into a solid mass or cake. It burns readily with a yellow flame, but on

account of its caking quality it is likely to clog the fire unless it is frequently stirred. The Newcastle beds mostly yield this form of coal.

*Cherry Coal* resembles in external appearance the pitch coal, and when exposed to heat it cracks and flies, but does not cake. It is very brittle, and on this account much loss is occasioned in mining it. It burns with a clear yellow flame. This kind of coal occurs in the Glasgow beds.

*Splint Coal* is a variety found in connection with the last, and is remarkable for its hardness, for which reason it is sometimes called hard coal. It is also found in Glasgow.

*Cannel Coal* has little lustre, is very compact and smooth in its texture, and breaks with a large conchoidal fracture. It burns very readily, giving out a clear yellow flame without melting. In consequence it has been employed for the making of candles—hence its name. It is often employed for making inkstands, snuff-boxes, and other articles of use. Their goodness for heating is tested by the quantity of water they evaporate —

Pure Welch Anthracite, 10 8½

The heating power of anthracite nearly doubles that of some bituminous coals.

*Brown Coal*, *Wood Coal*, *Lignite*, are names given to less perfect varieties of coal. They have a brownish-black colour, and burn with an empyreumatic odour. Under the microscope, the structure of the wood of the plant forming lignite can be readily detected. This is not the case with the other kinds of coal, where, although the woody fibre can be frequently made out, it has evidently undergone considerable change. The term *Brown Coal* is frequently applied to coal more recently deposited than that of the great coal-beds of the world, and is quite independent of its structure or any peculiarity in combustion. *Lignite* is also a term applied to the semi-carbonized forms of wood which are frequently found in deposits later than those of the coal deposits. It occurs in the tertiary deposits around all the shores of India. Most of these varieties of coal contain a large quantity of water, and the quantity of matter given off at a moderate heat by distillation is at least equal to that of the carbon contained.

*Dysodil* is a yellow or grayish highly laminated substance, often found with lignite, and burning vividly, and spreading an odour of assafoetida — (*Analyst*)

*Jet* is another variety of coal belonging to the bituminous series. It sometimes occurs in elongated reniform masses, and sometimes in the form of branches with a woody structure. It is soft and brittle with a conchoidal fracture. Its specific gravity is but little greater than that of water. It is opaque, of a velvet black colour, and has a brilliant and resinous lustre, and has been found in Southern India. The finer sorts are used in the manufacture of ornaments and trinkets of various kinds. The coarser sorts are mined as fuel. It gives out when burned a greenish flame and a strong bituminous smell, and leaves a yellowish ash. It contains about 37½ per cent of volatile matter — (*Eng Cyc Vol. II, p 10*)

Coal was worked in Bengal in 1774, by Messrs Heatly and Sumner of the Bengal Civil Service, who obtained a monopoly. Their operations were in the Raneegunge coal-field, but they found it unprofitable, and the mines remained unworked till 1815, when Mr Jores commenced operations. He too was unsuccessful, and in 1820, Messrs Alexander and Co undertook them. From that date, collieries increased in number, and in 1859, so many as fifty were at work employing 27 steam engines, producing 304,094 tons of round coal then. More than sixteen hundred people were then at work at the Raneegunge coal-mines. These have been excavated to a depth of 130 feet. The mines extend under the bed of the Damoda and a traveller can proceed three miles by torch-light through them. The coal beds are 300 feet in thickness (*Tr of Hind Vol I p 170*). The quantity of coals brought down in 1840 was about 15 laes of maunds. In 1850 it was nearly its double, and in 1860 it had become its quadruple. Coal has already been found in many parts of British India and of the south and east of Asia, and in several places is largely worked, to the greatest extent, perhaps, on the western side of Bengal, in China, and in Borneo. Only two generations have passed since it began to be used in Bengal, but the total annual out-turn of good coal in India in the 11 years ending 1868, in Indian maunds, has been as under —

India Coal		India Coal	
—		—	
1858	61,62,319	1864	90,46,147
1859	99,61,928	1865	88,37,953
1860	1,00,88,113	1866	1,08,34,551
1861	78,06,252	1867	1,18,61,051
1862	86,43,843	1868	1,35,62,274
1863	95,12,174		

Coal of good quality is obtained from the Koh-i-Meeriah, a hill a day's journey north of the Oxus (*Wood*) Mr Powell tells us (p 33) that in the Kangra district, in Dera Ismail Khan among the Murree hills, and in Jammu there are several places where glossy black lunellar lignite is found, associated often with surles, containing sulphate of iron, and belonging to strata of tertiary formation. In the Salt Range of the Punjab, there are two of the coal or lignite formations, which he distinguishes as Oolitic coal and Tertiary coal. Among the shales of the Oolitic series occurs what is called Kalabagh coal, which has to a certain extent been employed as fuel for the Indus steamers. This bed is in a ravine about a mile west of Kalabagh.

Carbon Coke	37 5

Ashes, silica, &c	2 5

100 0

The most important coal strata in the Salt Range, however, are the beds occurring in the Eocene rocks of the tertiary series. It is principally in the lower alum shales that coal occurs, and it is found at many places all along the range, and also across the Indus in Chichilli range. The first coal occurs at Baghanwalla, 10 miles west of Jalalpur, being about half-way between it and Pind Dadan Khan. The seam is about  $3\frac{1}{2}$  feet thick at its widest part, and gradually thins out towards either end. The coal from the Baghanwalla mine can be delivered at Mooltan for less than one rupee a maund. The coal of the Salt Range generally very much resembles that called splint coal, but is soft and brittle. It is not used as fuel by natives, but is ground to powder and administered with milk internally as an "osteocolla" for wounds and broken bones.

The seam of nummulitic coal appears to attain its greatest development at Baghanwalla, a place eight miles west of Jalalpur, close under the southern scarp of the Salt Range, and at the entrance to a gorge through which a stream issues, the way is up this gorge, and at a distance of about  $3\frac{1}{2}$  miles from the village the seam becomes visible. At Baghanwalla, the seam, when cut through in the water-course, was three feet six inches thick, occasionally a little more.

The prospect of obtaining Kashmiri coal in the Jammu territory, at one time attracted considerable attention, more especially as the engineer who noticed the workings at Dundeli confidently reported the strata to be of the carboniferous series. Since then, however, the coal of Dundeli has proved to be like the rest of Eocene origin among nummulitic lime-

stones, but undoubtedly the coal may be of local value. A large lump of it in the Lahore Museum might pass for "Wallsend," so good is its appearance. The coal at Bunnoo, from the Wuziri hills, has been mentioned with some hope, and specimens of coal have been sent from Kangra and Dharmkot, at Dharm-sala, but these also are tertiary and limited in quantity, and, in 1854, the verdict on Punjab coal, was that "It is valuable only for local consumption and to supplement wood, not for export, or to supply the province at large"—(*Powell, Handbook, Econ Prod Punjab*, p 33).

The supply and the consumption of coal in India during 1868 and the ten previous years, have been as under. The figures are in maunds of 80 lbs —

	Coal raised in all India	Coal raised in Bengal	Coal import- ed into Calcutta	Total con- sumption in Bengal
1858	61,62,319	61,62,928		
1859	99,61,978	99,61,928	12,29,160	1,11,91,088
1860	1,00,88,113	1,00,88,113	4,96,585	1,05,84,695
1861	78,06,252	77,85,085	12,85,203	90,70,293
1862	86,43,843	86,30,813	6,76,687	93,07,539
1863	95,12,171	95,01,975	10,36,407	1,05,41,382
1864	90,46,147	90,32,407	18,18,132	1,08,50,537
1865	58,37,953	58,10,425	16,16,143	1,01,26,568
1866	1,08,31,551	1,07,90,037	9,14,427	1,17,01,462
1867	1,18,61,031	1,18,47,178	11,46,734	1,29,93,902
1868	1,25,62,274	1,31,65,829	19,28,591	1,53,94,420

The 479,233 tons raised in 1867 rose to 547,971 in 1868, and almost the whole was from the Raneeunge field. One-half of the supply was consumed by the East Indian Railway. For several years there was a decrease in the demand for coal for other than railway purposes, but in 1867 and 1868 the tide turned. Still the consumption of coal by other than railways in 1868 was not so great as in 1863, it was 7,610,070 maunds against 7,667,258. The Raneeunge coal was used for locomotives as far as Umballa, and on the completion of the Delhi railway, it will doubtless compete with English coal even at such a distance as Lahore and Mooltan. The East Indian Railway will obtain a supply for its upper sections from Kumburbalee. In the Raneeunge field in 1868, there were 61 engines of 867 horse power in all, against 28 engines of 490 horse-power in 1860. The Bengal Coal Company turned out half the whole demand, or more than 6 millions of maunds, Gobind Pandit about  $2\frac{1}{2}$ , the Beerbhoom Company  $1\frac{1}{2}$ , the Equitable Company rather more than 1, and the East Indian Coal Company 830,605 maunds. Coal has been traced from Burdwan to the westward, across the Valley of Palamow, and from thence through the district of Sohagpore to Jubbulpore, and the neighbourhood of Saka, and the Towra

river in the Nerbudda territories, 420 miles distant from Burdwan. Observing nearly the same parallel of latitude, it is found in the province of Cutch, whilst it is extended in the same line across the centre of India to the N. E. extremity of Assam, forming a zone that stretches from  $69^{\circ}$  to  $93^{\circ}$  E longitude, embraced in an opposite direction between the  $20^{\circ}$  and  $25^{\circ}$  N latitude. Chanda, on the Warda river, Cuttack and Aracan being its southern boundary, whilst the Vale of Calhinge west of Allahabad, the Pesta river at the base of the Sikhim mountains, and Upper Assam, form the northern limit. The bituminous coal of Assam, the finest in India, has been little used owing to the difficulties of communication with the Brahmapootra. In Burma, the Prome district, up to the frontier of British Burma, so far as that lies to the east of the Irawadi, has nummulitic rocks, limestone, &c. They may be found to contain petroleum, as they occasionally do elsewhere. There are, however, other situations in which coal has been found distinct from this extensive and well defined belt, such as Hindwar and Attok, the first near the source of the Ganges, and the second near that of the Indus. Coal is found in the Manbhoom district, on Painsnath hill, at Husemabad, on Hosungabad, at Bora-ghui, Cuttack, at Talcheer and Ungot in the Nerbudda valley, at Kamrup in Upper Assam, and Moradabad. In the Damoodah valley, and the adjacent countries of Bheerbhom and Pooroolah Behar, Chanda is in  $19^{\circ} 56'$ ,  $79^{\circ} 19'$ , in E. Berar, two miles from the north of the Warda river, the mean height of the plain surrounding the town is 761 feet. The level of the Godavery, 525 feet, and coal has been found in its vicinity in abundance. The coal of Googoos near Chanda, at its first trial, was pronounced to be very dirty, and unsuited for locomotive purposes. It contains great quantities of gas, though it could not produce a welding heat. The deposit at Chanda occupies 150 square miles. Dr. Oldham has been satisfied with the result of his prospecting of the Chanda coal fields. A bore has been sunk near Telwassa on the Warda, through two feet of shale and more than ten feet of coal, of a better quality than that tested at Googoos, and resembling the finer coal of the Bullarpore beds. At Nowkera, to the south-east of Googoos, another bore hole has been sunk through fifty feet of coaly stuff with only a few partings of shale. The demand of centuries, Dr. Oldham tells us, is already provided for. The best found objection to the Chanda coal—a sudden enlargement or contraction of the seam, accompanied

often by a change in the quality—is now in a great measure removed.

The great Deccan trap area extends from Neemuch to the Kistnah river. In the Singhbhum country, are copper-bearing rocks, quartzites, slates, limestones, &c. These also cover the larger portion of the districts of Cuddapah and Kurnool, and appear, geologically, to represent in the south the older portion of the great Vindhyan series. Rocks of the same mineral character appear under the great flows of the Deccan trap, and resting quite unconformably on the gneiss rocks in parts of the Ranehoo Doab, the vicinity of Belgaum, and under parts of the ghats on the western coast. That they belong to the same general series as the rocks in Cuddapah and Kurnool there is no question. Stretching along the northern escarpments of the Nerbudda valley, passing across the district of Jabbulpur, and forming the whole of the Rewah country north of the Sore, this great series extends in a continuous mass far into Bengal, where the picturesque cliffs of the Rhotasgnrh hills form its steeply scarped limits on the left bank of the Sone. Returning towards the west by Sacaram, Chunar, Mirzapur, and a little south of Allahabad, the boundary thence stretches in a great sweeping bay or curve to the south by Kirwee, Bijawur, and crossing the Beas river, trends again north to Gwalior and Agra, and Futtipur Sikri, whence the line again trends to the south and extends to near Neemuch. The rocks belonging to this widely extended and important group, constitute one of the most remarkable and interesting series in all India. They become also still more important to the Indian Geologist when he finds representatives of the same great series covering immense areas in the Madras Presidency, Cuddapah, Kurnool, &c., stretching northwards along the flanks of the ghats, and up the Godavery country, until, in Berar and the adjoining parts of the Nizam's dominions, and again in Bustar and Chutteesgnrh, they constitute the rocky basis of very extended districts. They are divisible into several different groups characterized by peculiar lithological distinctions, and throughout the whole area described present a wonderful constancy of mineral composition.

In Chanda and Berar, one of the great sources of doubt as to the extent of the coal deposits arose from the fact that the beds in the group of rocks in which the coal here occurs (known to Indian Geologists as the Barakur group), had invariably a tendency to exhibit very great variation both in thickness and quality within short distances. They are often of great thickness locally, but thin out, and nearly dis-

appear within short distances this variation also being not only in the thickness, but also in the quality of the beds, so that what shows as a bed of good coal in a place may, within a few yards or a few hundred yards, pass into a shale without coal or even into a sandstone. But about 15 miles north of Dumagudiam, near the junction of the Tal-*river* near Lingala, coal was found. Mr. Medlicott is of opinion that the present limits of the coal measure fields in N India coincide approximately with the original limits of deposition, and are not the result of faulting, or even mainly of denudation. All these successive beds (possibly with the exception of the Talchir) representing an enormous lapse of time, agree in one respect, that they seem to be purely fresh-water (fluvial or fluvio lacustrine) or estuarine deposits. The Ramgunj, the Jheria, the Bokaro, the Ramghur, and the Karunpur fields all belong to the drainage basin of the Damoodah river.

Mr. W. T. Blanford reports that the coal-bearing (Damuda) beds of Korba, extend for *forty miles* to the eastward, as far as Rubkub in Udupur (Oodeypore). They also extend far to the south-east towards Gangpur, and to the northwards towards Sirguja, and in all probability are continuous, or nearly so, with the deposits of the same nature known to occur in those districts. Main Pat and the neighbouring hills, and all the country on the road from Main Pat through Chandaigarh and Jashpur to Ranchi, consist of metamorphic rocks with the exception of a cap of trap and laterite on Main Pat. Indications of the existence of coal seams were afforded by the occurrence of fragments of coal in the rivers, especially in the Mand. He found a few seams near Chitra, twelve miles west of Rabkub and nearly thirty east of Korba. Two or three are seen in the Mand, about three to four miles east-north-east of Chitra, but they are only from a foot to 18 inches in thickness. In a small stream, the Koba Naddi, which runs south of Chitra, one seam about three feet in thickness is seen near the village of Tendumuri, more than a mile south-west of Chitra. It is nearly horizontal, having a very low irregular dip to the west or south-west. Part consists of fair coal, the remainder is shaley. The only seam examined from which it is possible that a useful supply of fuel might be obtained, is exposed in the same stream rather near to Chitra, being about a mile from that village, close to the boundary of the village of Tendumuri. It appears to be of considerable thickness, perhaps 20 feet, and the lower portion appeared to be fair in places. The dip is about 15° to north-north-west. Lieutenant Sale, of the Chota Nagpur Topographical Survey, found a seam of coal about

four miles north west of Rabkub in a small stream running into the Mand, and this may be the source of the blocks in the river bed. Several coal localities have been lately found by the officers of the Topographical Survey, and recorded in their maps. They are all north of Korba and Udupur, and the Rajah of Jashpur said that coal occurred in his territory in the Khurea country, twenty-four miles north-west of Jashpur-Nagar, about one hundred miles or rather more west by south of Ranchi.

The Talchir field, near Cuttack, the detached areas of Talchir sandstones in the Sumbulpur country, and the Belaspur field, are limited to the Mahanuddy basin, the Palamow, the Singrowli, and South Rewah coals are all strictly confined to the Sone basin, the Chanda field, and the continuation of this field in detached areas down the Godavery valley, considerably below Dumagudiam, all are strictly confined to the basin of the Godavery and its affluents, while similarly the coal-fields of the Nerbudda valley are all limited to the drainage basin of that river. In other words, the great drainage basins of this country were on the large scale marked out, and existed (as drainage basins) at the enormously distant period which marked the commencement of the deposition of the great plant-bearing series.

At Cherra Ponji, a bed of coal is raised on an insulated summit 300 feet above the level of the sea, the accompanying rocks are identical in character with those having a similar relative position to other beds of coal of the same formation whether above or below the level of the sea. The insulated situation of the coal measures at Cherra Ponji affords an excellent opportunity for their examination, owing to the great extent of surface which is free from soil and alluvium, so that the geologist has no obstacle to encounter but the dense vegetation peculiar to the climate. The great sandstone formation, composing here as elsewhere the base of the coal measures, forms the lofty front of the mountains facing the plains. The lower beds consist of a coarse conglomerate, resting on greenstone after the manner of similar conglomerates in nearly all countries in which their fundamental rocks have been observed. When we consider that this is not merely the case with the sandstone of the Kassy mountains, but that the whole series of sandstones throughout Central India rest on the flanks of ranges of sienite, greenstone, and basalt, we cannot apply more appropriate language in elucidation of this general feature in our geology, extending as it does over an area of 1,800 geographical miles in length, and 300 in breadth, than the following remarks of De la Beche.—‘As

we can scarcely conceive such general and simultaneous movements in the interior strata immediately preceding the first deposit of the red sandstone series, that every point on which it reposes was convulsed and threw off fragments of rocks at the same moment. We should rather look to certain foci of disturbance for the dispersion of fragments, or the sudden elevation of lines of strata, sometimes perhaps producing ranges of mountains in accordance with the views of M. Elie de Beaumont. Had this idea resulted from observations in India, rather than in Europe, it could not have been more appropriate, or formed so as to convey a more accurate notion of the nature and connexions of our red conglomerates. Ascending through the series of beds of this rock in the Khissya mountains, we find the coarser strata occasionally reappear, succeeded again by the normal beds, which are fine, durable, and grey coloured. In some places, but especially when approaching the upper third of the series, the colours become variegated, and ultimately the whole, or nearly so, assume a brick red colour. The higher strata form a barren tableland, with lengthy sloping summits, extending to a distance of ten miles towards the interior of the mountains. The limestone and coal repose in an elevated position on either side of the adjoining summits, whether the rocks of which these last are composed occupy a superior geognostic position with regard to the coal or not, is somewhat doubtful, but as far as it is safe to determine from inquiries of a partial nature, we may consider the sandstone from the base of the mountains to the higher peaks along their flanks as an uninterrupted series of beds, and consequently, that the coal is a newer rock than the sandstone composing adjacent summits. In the sandstone upon which the coal and limestone immediately rest at Cherra, a bed of boring shells occurs composing a considerable portion of the rock in certain places. The shells were of the size and form of the *Teredo* navalis, but they are mineralized so unfavorably as to render it doubtful to what genus they really belonged. Reposing on the *teredo* sandstone near Cherra, a detached accumulation of limestone, with alternating beds of sandstone, coal, and shale, disposed in horizontal strata, form a precipice about a hundred feet high from the base. Coal, to a thickness of fifteen feet in places, occupies a middle position in these strata. A bed of loose, coarse and sharp sand, five feet deep, forms the roof of the coal, and a layer of soft sandstone, about two feet in thickness, rests directly under the soil upon a bed of clay about twenty feet deep. The clay holds an intermediate position be-

tween the roof of the coal and the superincumbent sandstone, it is of a yellow colour, but dark in some places, and intersected horizontally with thin layers of gravel coal, and an iron pyrites of little value and in small quantity. From their softness, these beds are easily though not uniformly acted upon by surface water, which peculiarity may have given rise to that wavy appearance observed by Mr. Jones and Captain Sage in the Burdwan and Palamow coal-fields.

The coal of Cherra is excellent for many purposes. Dr. Hooker found it generally used by the Assam steamers, and was informed on board that in which he traversed the Sunderbunds, some months afterwards, that her funnels consumed 729 lbs. per hour, whereas the consumption of English coal was 800 lbs., of Burdwan coal 840 lbs., and of Assam 900 lbs. — *Hooker's Himal. Jour.*, Vol. II, page 303.

*Arracan* — Coal has been discovered at Kyauk Phyu in the Arracan district near Ougidong, close to the anchorage of ships. It was first observed by Lieutenant Foley in 1833, and afterwards described by that gentleman and Captain Mirgrave (vol. II. *Asiat. Jour.* p. 595). The quality of this coal is good, but the quantity so far as it has yet been discovered is deficient. At Sandaw in the same district, Lieut. Mackintosh found coal in the Kingtelha neighbourhood, one specimen of this coal, mixed up with silicious matter, is said by Mr. Walters to form the substance of an entire hill (vide *Jour. Asiat. Soc.* II, p. 264) iron ores are also said to occur here in considerable quantity.

In Burma, this mineral is known to occur at three separate localities, all lying westwards of the Hawadi, at distances varying from five to seven miles of it. The most southerly of these localities is about a mile and a half west of the small village of Tembung, where it crops out for about fifty yards in the bank of a stream dipping to west  $30^\circ$ , and south  $15^\circ$ . The black bed in which the coal is there found is four feet thick, but only two feet nine inches of this is coaly, and the mineral is flaky, crinkled and jointed, the best layers of coal are about one foot three inches thick at the bottom of the bed. This coal is of a blazing character, burning freely and rapidly with a good blaze, but with the considerable ash of 27 per cent. A second locality is about five miles further north along the upper waters of the Kibung stream about five miles westward of the village of Thingadhu. The coal bed is five feet six inches thick, but the seam of coal which is flaky and woody is about three feet eight inches to four feet in depth. It contains jet-looking masses, and

drops of resin, which flame brightly The third locality lies about eight miles north-west of the village of Thingadlan, being exposed in the Manda Kyoung or stream It is flaky but hard, compact, and jetty, with small imbedded lumps of ambery-looking resinous matter This coal is of better quality and more durable, the roof is strong and the floor also good, and this is unquestionably the most promising of the three localities — *D. Oldham in Yule's Embassy* p 335

Coal has been found in the Malay peninsula, Sumatra, Java, and Luzon, and in Borneo, of good quality and suited to economical uses A seam of the Borneo coal was first discovered in one of the islands in the river of Brunai where it crops out It was afterwards found in the mainland, near the banks of the same river, and subsequently in the island of Labuan about 12 miles from its embouchure In these places it is at present mined by European skill and capital, and been found, on ample trial, superior to any Asiatic coal hitherto tried The coal on the left bank of the Borneo river has been traced for several miles into the interior On the southern coast of the island coal has been found in the territory of Banjarmasin and mined by the Dutch This from all accounts is of the same quality as the coal of the northern side, and may be a continuation of the same field, which would make the Borneo coal fields the largest in the world, after those of North America Steam navigation has given a value to the coals of Borneo, which, without it, in a country inhabited by rude people and covered with forest, might have lain for ages as useless as the lime and sandstones in which it is imbedded — *Crawford's Dictionary*, page 195

Coal occurs in several parts of Tenasserim on the Great and Little Tenasserim Rivers on the Lena, at Thyet-Myo

Mergui possesses valuable fields of coal The beds are very extensive, from nine to eighteen feet thick, and about sixteen feet from the surface The principal mine is about ninety miles up the great Tenasserim river It was at one time worked by Government, but did not prove remunerative and was suppressed from want of management The Mergui coal was regarded by the Coal Committee as true mineral coal, but of inferior quality A similar coal is found on the banks of Tenasserim north of the latitude of Tavoy, but Capt Tremenhare regards both as superior varieties of lignite "Lignite or brown coal," says Hitchcock, "appears to be peat which has long been buried in the earth, and has undergone certain chemical changes, whereby bitumen has been produced Bituminous coal is probably the same substance,

which has been longer buried in the earth and has undergone still further changes" The coal of the great Tenasserim valley appears to have been so long buried in the earth that the best parts of it are better than ordinary lignite and equal to the inferior portions of bituminous coal which is true of beds of lignite in other parts of the world "Eighty miles from Mergui, inexhaustible beds of coal of an uniformly good quality occur on the Thian Khan one of the main branches of the Little Tenasserim. The various beds are described to be what is called cannel coal, remarkable for consisting of upwards of 50 per cent of bitumen, a superior blazing material, which is the main point in getting up steam" Coal has also been found on the banks of the Lena river, south of Mergui It is a field for examination

Deposits of coal have been found along the Siamese coast from Penang to the vicinity of Junk Ceylon In 1836, specimens of coal were brought from Triang, one of the lower provinces of Siam, and subsequently a deposit was discovered at Tama, not far from Coal was found at Sungai Kamuning, about sixteen miles above Triang, and at a place, also, nearly east of Pulo Mutiara or Pearl Island, about twelve miles to the southward of S Kamuning It was also found at the Pulo Tiga island, lying off Pulo, on the coast of Kedah, but although this coal lies about thirty miles further south than the Triang coast coal, or rather S Kamuning, Colonel Low was inclined to believe them to be of the same coal field Another coal was found in the bay north of Tanjong Bumbong on the coast of Triang, betwixt the last place and Kamuning

The coal in Lager and Kedah on the west coast of the Malay Peninsula is identical in composition, in the proportion of volatile matter to charcoal, with some kinds of cannel coal Sp Gr 1.245,—Volatile matter, 46.746,—Charcoal 52.071,—Ash 1.183=100 That found on the southern coast of the island of Junk-Ceylon, (well known for its tin) and which occurs near the bank of a river and about two or three hundred feet from its mouth, was reported by Professor Ansted as adapted for every purpose to which coal is economically applied.

	Sp Gr	In 100 parts		
		Volatile matter	Coke	Ash
Junk Ceylon Coal	1.25	60.40	39.58	2.50
English Cannel Coal	1.27	60.00	40.00	0.30

The position indicated as a deposit of coal, is in Lat  $7^{\circ} 44' N$  and Lon  $99^{\circ} 15' E$ , the southern point of Pulo Lontar bearing S W by S Telebon S S E and Tanjong Cotton N E by N. Some of it takes on the polish of fine jet. The Ligor specimens of this jet are the best.

Coal is found at Rettie on the south-east coast of Sumatra, which bears a strong resemblance to that from Junk-Ceylon, sp gr 1.23 Volatile matter 51.43 Charcoal 48.57 Ash not determined.

In the coal of Ligor and Kedah on the west coast of the Malay Peninsula, one portion of jet had a beautiful lustre and high polish. The fracture shows a fine velvet black or brownish black. It was found by a Penang Siamese on the southern coast of the island of Junk-Ceylon, (well known for its tin) near the bank of a river, and two or three hundred feet from its mouth. This rested on a layer of sand, beneath which, and in contact with the coal, was a thin layer of blue clay. Colonel Low was led to think that the coal extends from the beach to a small hill or elevation which stretches for about 1000 feet in a N to S direction along the shore at a distance varying from 50 to 200 feet, in about latitude  $7^{\circ} 41' N$  and longitude  $99^{\circ} 15' E$ , the southern point of Pulo Lontar bearing S W by S P Telebon S S E and Tanjong Cotton N E by N (*Journ Ind Arch III* 153, 154, 161, 738). On the Malay Peninsula, at various localities along the western coast of that region, at Katani, Ayer Ramni, and Bencoolen, at the entrance of the river Reteh, and along the banks in the Batang Gausal and the Ingiagiri, with, it is supposed, the Kampar. In Sumatra, coal of serviceable quality exists, also in Banka and Madura (*New Rotterdam Courant*, Sept 23, 1851). In Borneo Proper (*Low Sarawak*, 12), on Pulo Keug Arang near the north end of Labuan, at various places on the west, south-west, and south east coasts of Borneo, at the Bunut, on Pontianak, the country of Banjarmasin, where immense deposits are found, Pagattan, and on the Koti river, mines are worked. A small field has been found near Macassar in Celebes, but the coal is of a worthless description (*See Singapore Free Press*, July 19, 1850, which describes the coal treasures of the Archipelago). It is said that fine specimens have been obtained from the Philippine province of Alalay (*Vallat, Les Philippines*, I 122) but the existing notices of them are slight. In Labuan large mines have been opened.

In Borneo, coal is associated at Pulo Chirmin, which is about 200 feet high, with a ferruginous sandstone, and overlaid by a mass of red sand and clay. At Pulo Lang Arang

again, the coal is overlaid by white sandstone. Borneo, as a mineral country is perhaps the richest in the East, producing gold, coal, antimony and iron, while caoutchouc and gutta percha are amongst its vegetable products. The coal and iron fields of the Balawi or Rajang are more extensive than any yet discovered on the island. From the river Baram, coal is traced to the upper parts of the Bintulu, and thence southward to the Rajang river, on the left bank of which, at Tujong-Nang, there is a seam exposed upwards of thirteen feet in thickness. At different other parts of the river, and also in several of its branches, coal is found in abundance.

In China, coal is generally used for fuel in all those places which have been visited, and the supply might probably be greatly increased by introducing machinery and European modes of working it. The boats on the North river, below Ningning, lie near the mouth of a horizontal shaft worked into the mine, above which the cliffs are scraped down as the shaft advances. The ignorance of the Chinese of the best modes of draining and ventilating mines, must necessarily prevent the working of many of them beyond a certain depth and extent. The mountains of Shansi and Chihli supply large quantities of this valuable mineral, and many boats find constant employment in bringing a coarse anthracite from Kuchan in Liautung to Tientsin. One locality of the mine in Liautung is about lat  $39^{\circ} 10' N$ , and long  $121^{\circ} 25' E$ . Several kinds, both of anthracite and bituminous coal, have been seen in marts at the north, and coal dust and refuse is mixed with a little moistened clay at Peking, and made into cakes for the fires of the poor, that which is brought to Canton is hard, and leaves a large proportion of ashes after combustion, during ignition, it throws off a suffocating sulphureous smoke, which prevents the natives using it for cooking. It is employed in the manufacture of copperas from hepatic iron pyrites, according to Du Halde, but is less frequently employed in the arts than it would be if the people knew better how to use it.

Coal is found abundantly at Ke Lung in Formosa. Coal is found in the districts around Negata in Japan. The Russians, under the command of a Russian officer, have opened coal mines rather lower than Tonquin Bay — *Singapore Free Press*, April 2, 1852. *John's Indian Archipelago*, Vol II, p from 349 to 351. *Colonel Low*, No 3 *Journ Ind Arch*. *Williams' Middle Kingdom*, p 242. *Hodgson's Nagasaki*, p 227. *McCulloch's Dict* p 287. *Journ Ind Archip Eng Cyc Calc Rev Annals Ind Admin Mason*.

COBITIS, a genus of fishes belonging to  
the abdominal Malacopterygii, and family  
Caprimidae This genus includes the Loaches  
*Engl Cycl p 41.*

COBRA, the ordinary name by which Eu-  
ropeans in India designate the Naga genus of  
venomous Colubrine snakes of the family  
Elapidae There is only one species, the  
Naga tripudians which has a moderate body  
with rather short tail It has a small or  
moderate eye, with a round pupil, a poison  
fang in front of the maxillary, which is  
but little movable or erectile, and only  
one tooth behind The anterior ribs are  
elongate and erectile, and the skin of the  
neck is dilatable When the cobra rises  
in play, or for amusement, it spreads out  
the skin of the neck, from which it gets  
the Spanish name of "Cobra di Capello," in  
English the "Hooded Snake" Its bite is  
certain death. It is said that the poison can  
be combated by injecting potash into the  
veins, but, owing to the rapidity of the poison's  
action, this, even if true, is valueless. Not-  
withstanding this, the natives of Ceylon do  
not kill the cobra when caught, but enclose  
it in a mat bag with some boiled rice for  
food, and place it thus in a flowing stream  
In Guzerat the hindoos do not kill this or  
any other snake There are two varieties of  
the Naga tripudians—

*Var (a)* The spectacled or Bin-ocellate  
cobra has its neck, on the steel brown skin,  
marked with a white, black edged  $\subset$  or  $\supset$   
enclosing at either extremity a black ocellus  
This is only seen when the hood is expanded  
It is found in Southern India and in Bur-  
mah? It grows to  $5\frac{1}{2}$  feet

*Var. (b)* The monocellate or one mark-  
ed cobra, has a plain white ocellus, with  
black centre and margin, and grows to 4  
feet in length It is the cobra of Central In-  
dia and Burmah (*Nicholson*) The cobra  
is worshipped by all hindus, and its form, as  
an idol, with three or nine heads, in stone  
or brass, may be everywhere seen in India  
It is often bending over the idol of the

lingam The cobra sometimes swims out to

COCCIDÆ of Leach, the *Gallinsecta* of  
Latreille, a family of insects placed by La-  
treille and others at the end of the *Homoptera*  
The insects belonging to this family live upon  
trees or plants of various kinds they are of  
small size, and in the larva state have the  
appearance of oval or round scales, hence  
they are called Scale Insects They are  
closely attached to the plant or bark of the  
tree they inhabit, and exhibit no distinct ex-  
ternal organs At certain seasons, when about  
to undergo their transformation, they become  
fixed to the plant, and assume the pupa state  
within the skin of the larva The pupa of  
the male has the two anterior legs directed  
forwards, and the remaining four backwards,  
whereas in the female the whole six are di-  
rected backwards When the males have as-  
sumed the winged or imago state, they are  
said to issue from the posterior extremity of  
their cocoon In the spring time the body  
of the female becomes greatly enlarged, and  
approaches more or less to a spherical form  
In some the skin is smooth, and in others  
transverse incisions or vestiges of segments  
are visible It is in this state that the female  
receives the embraces of the male, after which  
she deposits her eggs, which are extremely  
numerous In some, the eggs are deposited

by the insect beneath her own body, after which she dies, and the body hardens and forms a scale like covering, which serves to protect the eggs until the following season, when they hatch. The females of other species cover their eggs with a white cotton like substance, which answers the same end. Of the species of this genus, *Coccus maniparus* is said to puncture the *Tamarix gallica*, and produce the Arabian manna. *C. cacti* produces the cochineal, and *C. lacca* the lac — *Eng Cyc Vol II, p 43*. See *Coccus*.

This plant is used in native medicine. A decoction of the fresh roots is given in rheumatism, and is considered heating, laxative and sudorific, a curry of the leaves is used for the same object. The juice of the ripe berries makes a good, durable, bluish, purple ink. The withies are woven into small baskets, and are used for cords by the cultivators — *Voigt* 331.

**COCCUS**, a genus of insects belonging to the order Hemiptera, the species of *Coccus* known in India are the *C. cacti*, the cochineal insect, the *C. lacca*, that yields the stick lac of commerce, and the *C. maniparus* of Arabia, that punctures the *Tamarix gallica*, and causes the exudation of the Arabian manna. There are two varieties of *Coccus cacti*, the true *grana fina*, and the *grana sylvestris*, and after prolonged efforts on the part of Drs James Anderson and Barry of Madras, in 1795, the *C sylvestris*, or wild species of the cochineal insect, was introduced into Bengal by Captain Neilson of H M. 74th Regiment. It thrives

rapidly on the *Cactus indica*, the indigenous opuntia, the country Nopal, and between 1800 and 1807, 74,366½ lbs of the cochineal, amounting to Rupees 142,916 in value, was shipped to England, but at a loss, as the wild species was found greatly inferior to the true. The cochineal insect was introduced into Java about the year 1825, as a Government experiment, and apparently with more success in its production than in British India, for as long ago as 1844 it was exported from Batavia to the estimated value of 93,319 guilders. The species introduced into India swarms at certain seasons, and settles on one of the species of *Cactus*, which they immediately destroy. The whole neighbourhood of Honnabad was surrounded with prickly pear but disappeared in 1865, under one of these swarms — *Royle, Prod. Re*, page 57. *Crawford Dict* page 112.

## COCCUS ILICIS See Kermes

**COCCUS LACCA** produces the substance called lac, it inhabits India, is found on various trees in great abundance on the *Ficus religiosa* and *F Indica*, *Butea frondosa* and *Rhamus jujuba*. "When the females of this *Coccus* have fixed themselves to a part of the branch of the trees on which they feed, a pellucid and glutinous substance begins to exude from the margins of the body, and in the end this substance covers the whole insect with a cell, which, when hardened by exposure to the air, becomes lac. So numerous are these insects, and so closely crowded together, that they often entirely cover a branch, and the groups take different shapes, as squares, hexagons, &c, according to the space left round the insect which first began to form its cell. Under these cells the females deposit their eggs, which, after a certain period, are hatched, and the young ones eat their way out." It is found encircling twigs and branches. The broken twigs covered with these incrustations are called 'stick lac' in commerce. After the colour has been extracted and further purified, shell lac results — *Kirby and Spence, Vol IV*, p 142, quoted in *Eng Cyc Vol II*, p 144.

## COCCUS PELA See Flaxinus

**COCCUS POLONICUS** is a species which is used in dyeing a red colour. It is now chiefly employed by the Turks for dyeing wool, silk, and hair, and for staining the nails of women's fingers — (*Kirby and Spence Vol I*, p 320) *Eng Cyc*, p 44.

## COCHIN See Cocoa-nut palm

## COCHENILHA Port Cochineal

## COCHENILLE Fr Cochineal

**COCHIN** A town on the Malabar Coast, in lat 9° 58' N long 76° 15' E. The

bar has on it 14 or 15 feet, and is navigable by vessels of 600 and 700 tons (*Horsburgh*). Cochin harbour appears to be the best on that coast. Captain Ouchterlony is of opinion that, with a few simple works, the water over the bar could be deepened (*Universal Review*). Cochin town is the capital of a principality ruled by a rajah. The primary source of income was Rupees 6,00,721 in 1044. This increase was chiefly due to the increased area of land under cultivation, the greater yield of the Nelhampathy coffee estates, and the extended operations in the Trichoor lake. The revenue derived from customs duties during the year 1044 was Rs 1,15,099, being in excess of that of the previous year by Rupees 9,137. The abkarry farm produced Rs 29,009, the opium farm Rs 8,450, and salt Rs 1,42,663. Various schools are making steady progress. At a principal school at Ernacollum there are 256 students, the majority being brahamins, sudras, and Roman catholics, who form the larger sections of the population. During the year 1044, a fund had been raised, wholly by the students and teachers, to assist poor and deserving scholars in their education, and through its instrumentality 20 of the poorer scholars receive aid to help them to bear the incidental expenses of their schooling. Report speaks highly of the capabilities of the port of Narrakal, at which place the mails have been landed at the worst periods of the monsoon, without the slightest interruption. In the year 1044, 25 vessels, with an aggregate tonnage of 15,484 tons, arrived at Narrakal, against 14 vessels and 8,315 tons in the preceding year. The port dues amounted to Rs 854.

The ruling family are of the first class of the chiefs of India, and are liberal-minded. The territory is 1,131 square miles with a population of 399,060, the taxation falls at Rs 2 $\frac{3}{4}$  per head. The rajah's family follow the rule of *manu makatayum* or *Descensus ab utero*, the children of sisters succeeding. If the rajah's younger brother be senior to all his nephews, he becomes *Eliah rajah*, or heir apparent. But if the rajah's eldest sister have a son older than the rajah's brother, the nephew ranks in the line of succession before the uncle. Cochin was a Dutch town, but was captured by the British in 1798. It has considerable trade with the Persian Gulf and the Arabian Coast, and ship-building is largely carried on.

COCHIN-CHINA, the name given in Europe to a kingdom occupied by a people known as the Anam. The derivation of the European name is obscure, but Kachao is the

name given by the Anam people to the capital of Tonquin, and Cochin China is known to the Malay navigators as Kutchi, but they give the same name to Cochin on the Malabar coast. Cochin China has probably been so called from the alliteration so common with easterns, aided by the proximity of China, and may be derived from Kachao the capital of Tonquin and China, so that Cochin-China may mean the Kutchi near China. It has been supposed by D'Anville that the Sin hoo of Ptolemy, the geographer, is Cochin China, and that the Aureo Chersonesus of Ptolemy is the Malay peninsula. According to Latham the natives on the borders of British India, to the N W, the N E, S E and East, form an ethnological group, which contains the Tibetans, the Nepal tribes, several populations of the Sub Himalayan range, the Burmese, the Thais, the natives of Pegu, the Cambodians, the Cochin Chinese, and the Chinese, in populations which cover perhaps one fifth of Asia. They have a general similarity, they are somewhat fair in complexion, with traits that are called Mongolian features. There are, in their religious sects, mahomedans and jains, but the buddhist, Confucian, and Lao philosophies are used as religions, and almost all believe in the transmigration of souls to allude a final absorption. One of these is the Annamese, or Anamite group of peoples inhabiting Cochin China and Tonkin, and are a subdivision of the division to which the Chinese belong. The Chinese form of Anam is Ngan-ben. The language is monosyllabic. The Annamese call the Cochin Chinese Kuang Toi Kckuang, names probably the same as Kien and Kakhien. The Cochin-Chinese, on the other hand, call the Tonkinese Kepak on.

The Cochin Chinese have a little more colour, and are fairer than their neighbours immediately to the west and south of them. The Anam race, (comprehending under this name both the Cochin Chinese and Tonkinese,) there is very little difference between them, are fair, but are a short, squat, and unfavoured people, with long arms and short legs. They are probably lower in stature than the people of Central Asia. Their limbs are long and well formed, and they are active and sturdy. In point of features, they bear a nearer resemblance to the Malay than to any other people, their countenances exhibit an air of cheerfulness and good humour. The women are, to a remarkable degree, fairer and handsomer than the men, their hands, arms and feet are well formed, and the carriage even of the lower classes is graceful. The women, still fairer, are well formed and graceful. The dress of both sexes is becoming, it is the old costume of

China, before the Chinese were compelled to adopt that of the Tartar conquerors. Both sexes dress nearly alike. For the lower part of the body, the covering consists of a pair of loose trowsers, secured at the waist by a sash. The main portion of dress consists of two or more loose frocks, reaching half-way down the thigh. This, for such matters, as among other Eastern people is uniform and constant, overlaps to the right side, and is secured by five buttons and as many loops. Its sleeves are loose, and with persons not compelled to labour, they dangle a foot, or even a foot and a half, beyond the extremities of the fingers, but the labouring classes from necessity, wear them short. With the women, the inner frock reaches below the knee, and the outer down to the ankles. When a Cochin Chinese is in full dress, as when he makes visits or is engaged in the performance of religious rites, he always wears over the frocks now mentioned a loose silk gown reaching to the ankles. The hair of the head is worn long and put up in a knot at the back of the head, as was practised by the Chinese before the present fashion was imposed upon them by the Tartars. Both sexes wear turbans, which are put on with much neatness and the form of this article of dress, which is always determinate, distinguishes the civil from the military order of public officers.

The poorer people, except when dressed, seldom wear these turbans. When abroad, both sexes wear varnished straw hats, little less than two feet in diameter, tied under the chin. These, which are sometimes in the form of an inverted basin, and at others resembling a sugar-loaf, afford, however grotesque in appearance, good protection against sun and rain. The materials of dress consist of silk or cotton, the first being of more frequent use than in any other country. The inner frock is cotton of domestic manufacture, always, in Crawford's time, unbleached, for, then, there was not a rag of white linen in the kingdom. The outer frocks and gown with the better ranks, are always of silk, or flowered gauze, and the latter is commonly of Chinese manufacture. The trowsers, with the same class, are either plain silk, or crape of domestic fabric. The turban is crape, always black or blue, but most frequently the former, and this is also a home fabric. The lower orders are generally clad in cotton, but, even among them, silk is not unfrequently to be seen. Their cotton dress is very generally dyed of a dark brown colour, as if trimmed. This colour is given to it by a tuberculous root. Ornaments of the precious metals, or gems do not appear to be very general. The women wear occasionally armlets and bracelets of

gold. Where gems are worn, those of most frequent use are pearls, and amber brought from Yu-nan. The women wear ear-rings and secure the hair by a bodkin with an ornamented gold bead. Men of all ranks, and women above the labouring class, always carry about them a pair of silken bags, or purses, strung together, and usually carried in the hand, or thrown over the shoulders. These are intended to carry betel, tobacco, and money. Women of the labouring class are forbidden to use them, and men of the same order, when they meet a person of condition, must as a mark of respect, take them off their shoulders and conceal them. These purses are generally of blue satin, and with the better classes often richly embroidered. The shoes that are worn by the Cochin Chinese are slippers without heels. P 485 to 487

The Cochin Chinese are addicted, to an extraordinary degree, to the use of tobacco which they chew and smoke. The Cochin Chinese are a mild and docile people. The lower orders are remarkable for their liveliness. They are always to be seen talking and laughing. The higher classes affect the grave and solemn demeanour of the Chinese. In their habits and persons, the Cochin Chinese are an uncleanly, dirty people, they perform frequent ablutions, but, notwithstanding this, their hair, their skins, their hands, including the long nails which they are so fond of wearing, are absolutely impure. Their linen, not bleached at first, seems never to be washed afterwards. At home, they wear then foul cotton shirts, and when they go abroad, without changing them, they clap over them their fine silk robes. This neglect of personal cleanliness they perhaps carry to a greater length than any of the nations of the further East. Their diet is indiscriminate. They eat vermin, and the flesh of the crocodile; hatched eggs with them are a delicacy, and their favourite sauce is a kind of soy, in part, at least, composed of the juices of putrid fish, and which, both from taste and odour, would be intolerable to any other people. Like the Siamese, they are nationally very vain, and consider themselves the first people in the world, being hardly disposed to yield the palm even to the Chinese, the only strangers whom they are disposed to consider respectable. They consider the Kambojans barbarians, and scarcely think the Siamese much better. But their nationality, excessive as it is, is much less offensive than that of the Siamese, for with strangers they are sociable, good humoured, and obliging. Young women are not restrained to chastity, but are allowed freely to associate with men. But adultery in the married woman is punished

with death. A Cochinchinese marries when he has the means, and among the poorer classes the age of the female is from 15 to 20. The wife is purchased, polygamy is habitual. Abortion is often had recourse to. In Cochinchina divorce is completed by breaking a copper coin or a pair of chopsticks before witnesses. Cochinchinese are ever gay and always talking, open and familiar, and entrust women with the chief concerns of the family, and they are quite as gay as the men. The Chinese always grave and affect to be thinking, close and reserved, never commit any affair of importance to a woman. The Chinese code forbids a woman to talk unless by way of reply, or to laugh beyond a smile, or to sing unless desired. In Cochinchina all the labours of tillage devolve on the peasant women, and in towns the women, in addition to their domestic duties, superintend all the details of commerce and even help in manufactures. The religion is Buddhism, but shaman superstitions also prevail.—*Latham's Descriptive Ethnology Crawford's Dictionary*, pp 321 to 488. See Buddha China, India, p 309, 316, 319, 343 and 344. This valuable dye and colour material consists of the dried bodies of the female of the *Coccus cacti*, a native of Mexico, and an idea of the value of it may be given by mentioning that Great Britain pays annually about £440,000 for this insect. In 1850, 1122 tons were imported into Britain, price 3s 6d the pound. It forms a very fine and permanent dye of red, crimson, scarlet. It answers on wool and silk, but not on cotton. It is a most expensive colour, and is rarely in the hands of the native dyer, but if supplied to him, he understands the method of using it. Efforts were made by the E I Company to introduce the insect into India, and at the close of the 18th century it was supposed that Drs Anderson and Barry of Madras had succeeded in doing so, but it is said that an inferior variety, *C. Cacti sylvestre*, occurs in S America, which was the one brought, not the variety designated *C. Cacti grana fina*. Whether from the stock introduced in 1799, or from an indigenous variety, the *Coccus cacti* is at seasons plentiful in many parts of India. They swarm to localities where the prickly pear grows and in a brief time, the plant wholly disappears. At Homnabad recently, a great field of it withered

up under them. What was exported from this importation proved to be small and deficient in colouring matter, and very inferior to any brought from new Spain. At the Madras Exhibition of 1857, the Cochineal exhibited from Chittledroog was from "*Coccus cacti*," and was said to be the "silver grain." It has been mentioned that at Vizagapatnam is a great deal of the red flowering prickly pear, on which the cochineal insect feeds, that the insect under propagation at Oosoori has been ascertained to be the true cochineal insect, and to be procurable in several districts in Southern India, but that it only destroys the plants with red flowers and few prickles, and that it will not propagate on the yellow flowering prickly pear, or *Opuntia*. I have seen it tried at Bellary and fail. The red flowering *Opuntia* is abundant at several localities in the peninsula of India. The Cochineal insect was introduced into Java a few years ago, as a Government experiment, and apparently with more success in its production than in British India, for so long ago as 1844 it was exported from Batavia to the estimated value of 93,319 guilders, and it has been exhibited from Java at the recent Exhibitions in Europe as having been grown in considerable quantities on the Government plantations. The people have also been successful in introducing it into the Canary islands, where it has of late been much cultivated, and in 1856, no less than 1,511,617 lbs were exported. Cochineal is both wild and cultivated. The insects, of which there are about 70,000 to the lb, are detached from the plants on which they feed by a blunt knife, they are dipped in boiling water to kill them and then dried in the sun. There seems to have been a species of Cochineal in the Jalundhar Doab, there was in the Sikh times, a species of cactus so abundant and rapid growing, as to become a nuisance, and rewards were offered for its extermination, which however were, shortly after, rendered unnecessary, as a large number of insects of some kind of *coccus* appeared and soon effected the destruction of the plant which is now only occasionally to be met with. From the travels of Lieut Burnes and Dr Gerard, we learn, (*Journ As Soc of Bengal, Vol II p 652*) that a species of cochineal is found on the root of a plant which flourishes in a marsh (near Herat), but the natives being unable to dry it, import it from Bokhara and Yaukand, paying about 32 sicca rupees per Indian seer. *Coccus polonicus*, the scarlet grain of Poland, is also found on the roots of a plant, the *Scleranthus perennis*—*Royle Ill Hm Bot p 85 Madras Exhibition of 1857 Powell Handbook Ec Pro-*

This tree grows in Travancore and on the Comandel coast, Dr Roxburgh describes it as common on the Arracan mountains, it occurs also in Bundelcund, on the hills round and near Adjigurgh and Kalingui, as well as on those near Hurdwai, and the Kheree pass. It is a large tree with downy shoots. Of the leaves are made, the curious rude leaf-bellows with which the natives of the hills near the Assam valley smelt iron. Botanists usually place it amongst the Theads (*Ternstroemia*)

These trees have curious thick branches which spread out somewhat awkwardly, each tipped with a cluster of golden yellow flowers, as large as the palm of the hand, and very beautiful. It is a tropical Gum-Cistus in the appearance and texture of the petals and their frail nature. The bark abounds in transparent gum, of which the white-ants seem fond, for they kill many trees. This is the gum katira, which in the N W Provinces of India is substituted for Tragacanth, wood soft, and only used as firewood, the cotton of its pods is used for stuffing pillows. This tree is not seen west of the Jumna, but it probably exists in the Sewalik region in the east of the Punjab, its gum is officinal being used as a demulcent in coughs &c — *O'Shaughnessy, page 225 Dr J L Stewart Hooker Himal Jour Vol I, page 53 Voigt 91*

COCHOA PURPUREA The sole bird in India of the family Ampelidæ, it is found in Nepaul. See Birds p 501

COCK, the male of the domestic fowl of the genus Gallus. One species of the genus Gallus is found in the wild state in the Malay Peninsula, two in Sumatra, two in Java, and one in the Philippine Islands. It is remark-

able, however, that no bird of the genus in the wild state is to be found in Borneo, Celebes, or any island of the Molucca Seas. Several of these supposed species are probably the same. The two of Java are distinct species, they will pair, but the progeny is a male, a beautiful bird kept by the wealthy Javanese as an ornament of their poultry-yard, under the name, well known to them of Pakiser. The wild fowl of the Philippines is sometimes tamed, and, by the courage it displays, shows that it is of the true game breed, and probably identical with the domesticated bird. The authors of the Spanish Geographical Dictionary in their introduction say of it — "In the woods there are beautiful wild cocks. These are very brave in the combat and always come off victors with the large but cowardly cocks of China, and not with these alone, for they will contend with the famous gallant breed of the Loguno." Most of the advanced nations of the Asiatic Islands are gamblers, and the favourite shape which gaming takes with them is cock fighting. This includes the people of Bali, Lombok, Celebes and all the Philippine islands, the only material exception being the Javanese. The passion for cock-fighting is impressed on the very language of the Malays. Thus there is a specific name for cock-fighting, one for the natural spur of the cock, and another for the artificial, two names for the comb, three for the crow of the cock, two for a cock-pit, and one for a professional cock-fighter. The passion is no where carried further than in the Spanish dominions in the Philippines. There, it is licensed by the government, which derives from it a yearly revenue of about 40,000 dollars, or about £10,000.

The nations of Central Asia seem from time immemorial to have used the cock in sacrifice. It has ever been a sacrificial victim, being especially sacred to the sun, in Sabæan worship. And this still continues. It is offered in sacrifices on the new year's day by the old Parsi fire worshippers. The Aryan Hindoo and the non-Aryan races all sacrifice the cock at the shrines of the earth goddesses. See Birds, Fowls, Gallus — *Crawford Dic p. 113*

COCOACEÆ, the palm tribe, the Palma-cæ of Lindley, are inhabitants of the tropics of both worlds, and hardly range beyond L. 35° S, and L. 49° N. They are local plants,

only *Cocos nucifera*, *Acrocomia sclerocarpa*, and *Borassus flabelliformis* are found in many lands. There are supposed to be about 1,000 species, but scarcely a fifth part have been described. The "*Oreodoxa oleracea*," or edible Cabbage tree of the W. Indies has been introduced into the East. The "*Areca catechu*," is well known for its betel nut, the "*Arenga saccharifera*" for its sago, palm wine, sugar, and black horse-hair like fibres. One tree will yield lbs 150 of sago-meal. The "*Caryota urens*" valuable for the immense quantity of its sap, which is fermented into toddy or palm wine, or distilled into arrack. Canes and rattans are from the various species of "*Calamus*." The "*Sagrus lœvis*" and *S. famifera* yield much of the sago of commerce. The "*Borassus*" or palmyra is of great value for its palm wine, its fruit and its leaves, as also is the fan palm "*Corypha umbraculifera*," the talipot palm of Ceylon and the Moluccas, while "*C. taliera*" is of great value for its leaves, which are formed into the palm books on which the people write with a steel bodkin. The date fruit, on which so many of the Arabs subsist, is from the "*Phœnix dactylifera*," and the "*P. sylvestris*" of India furnishes sap largely, which is made into palm wine, sugar or arrack, and the widely spread cocoanut tree, "*Cocos nucifera*," with its multitude of uses, all belong to this order. More recently, the following have been noticed

## COCOA

Cacao	Fr	Cacao	It	Port	Sp
Kakao	GER				

Cocoa, also written Cacao, is the nut or seed of the *Theobroma cacao*, a plant of the West Indies and the continent of America. Lindley, however, mentions also *T. bicolor* and *T. guineensis*. *T. Cacao* has been introduced into India, into the Philippines, and into the northern peninsula of Celebes and Amboyna.

At the Madras Exhibition of 1855, the Cocoa seeds were sent by General Cullen from his gardens near Oodagherry, 1,800 feet above the sea, they were of good quality, the beans being plump, ripe and clean, but small, not well cured and without colour. It is of great consequence to get good Cocoa grown in India. The climate and soil of the western coast would appear peculiarly favourable. The Cocoa flourishes best in the alluvial soil of mountain valleys, though it will grow well at some elevation on mountain sides. Great care should be taken in the selection of plants, as the varieties are numerous, some producing very superior fruit to the others. As to the distance at which the plants should be placed, some authorities consider that from 12 to 16 feet apart is sufficient, others maintain that 30 feet is not too much. A free ventilation

of air should be insured to the tree, after it is come to its full growth, and this cannot well be attained with a smaller space than 30 feet. The cocoa plant requires large forest trees of favourable sorts to be scattered amongst them, to protect them—the tree used for this purpose in the West Indies and South America is one of the Bombaceæ. The average return of cocoa per tree, when the trees are planted close together, is from 1 to 3 lbs. There are two crops in a year, but as much as from 9 to 16 lbs may be procured by proper planting and cultivation. On the low islands of the Tocantus river, 10,000 trees produce annually only lbs 3,200 of the chocolate nut, but well cared for trees produce on the average lbs 32 each. The average yield of plantations on the Amazon near Santarem is 700 Aroba (lbs 22,400) to 10,000 trees.

The plants begin to bear at from 5 to 7 years of age during this period the interspaces between the rows of trees can be rendered productive by planting yams and vegetables in them. Great care is required in curing the cocoa, after it is separated from the pod, and on the method of fermenting and drying depends very much the production of a good or bad article. Cocoa contains the alkali theobromine, in which there is a larger amount of nitrogen than in theme, so that tea, coffee and cocoa may all be regarded as containing the same nutritious principle. As seen in the market, cocoa is in the form of flake, granulated, soluble, rock, dietetic, homœopathic, cocoa, brioma, &c. Cocoa is adulterated with 5 to 50 per cent of sugar and starch. Flake cocoa generally contains the worthless husk which forms about twelve per cent of the seeds. Genuine flaked cocoa of good quality cannot be purchased under ten pence or one shilling per pound, but it is no uncommon circumstance to see in London shop-windows samples ticketed fivepence and sixpence per pound, such samples at this price must either be damaged or adulterated.—*M E J R Simmonds* See Cacao, Chocolate. Theobroma Cacao.

**COCOANUT** The word cocoa is supposed to come from the Portuguese word Macaco or Macoco. This is the fruit of the cocoanut tree, the *Cocos nucifera*. The cocoanut is encased in a thick fibrous husk. The substance of the shell is very brittle, and its structure is somewhat fibrous, but it admits of being turned in an agreeable manner. Shells which are tolerably circular are used for the bodies of cups and vases, the feet and covers being made of wood or ivory. Common buttons are also made of the cocoanut shell, and are considered better than those of horn, as they do not, like that material, absorb

moisture which causes them to swell and twist. The hollow shells, called "gari" or "naryel," are used for the water holder of a particular kind of "hooka." Cocoanuts, both in the raw and dried state, form a prominent feature amongst the exports to various parts of India and to other countries. The shipments take place chiefly at Galle and Colombo, and amount in value to about £14,000 yearly. Cocoanuts valued at £50 a ton were imported into Great Britain in 1861 to a considerable extent. They are sold in Liverpool at 20 to 30s the 100. The kernel, known as Kopra, is daily used in almost every house in India, as part of the curry materials, and from it is expressed the cocoanut oil of commerce.

The fruit bearing power of the cocoanut palm may be considerably improved by extracting toddy from the blossom shoots for the manufacture of jaggery during the first two years of its productiveness, after which it may be discontinued. The subsequent annual produce may be safely reckoned at fifty nuts per annum.

The cocoanut is a valuable product of the tree, as from ten to twelve large nuts, besides several small unproductive ones, may be seen on each bunch. In good situations, the fruit is gathered four or five times in the course of the year. The albuminous substance within, the "Kopra" or the kernel, is used as an article of food, and when dried is largely exported to other places as the "copra" of commerce, and the clear sweet liquid which the nut encloses when young is a very agreeable drink. It is indeed the albumen in a liquid state. In Ceylon, house plasterers attribute an adhesive quality to this water of the green nut, and mix it with their white and other washes, in which lime forms a chief ingredient.

The shells of the green nuts, fixed on stakes, are used as illumination lamps.

The full ripe nut contains a small quantity of only milk and is then used for making oil. Cocoanut milk is extracted by pressure and is used in making curries, &c. It is from the husk of the cocoanut that the well known "Coir," khor, khair or roya, fibre of commerce, is prepared, and used for the manufacture of coir rope, matting, brushes, &c. Cocoanut husk, from which the fibres have not been separated, is used in the East in lieu of a scrubbing brush for the floor, and for polishing wood, brooms, mats and bags are likewise manufactured from it.

The nuts are made into hookahs, goblets and cups, and when mounted with silver, polished and carved, are very handsome, but for everyday household use, they are made into lamps, ladles, skimmers, and spoons. The shells

make good lamp black, and when reduced to charcoal and pulverised, an excellent dentifrice. The cocoanuts are hourly used as offerings for hindoo idols. The cocoanut, when fully ripe, can be hollowed and cleaned, by being filled with salt-water and buried for some time in the sand, when the albumen decays, and is washed out. *Theedgold*

**COCOANUT TREE BEETLE** *Butocera rubus*

**COCOANUT CRAB**, the *Bugus latro* or robber crab of the Keeling islands, is a kind of intermediate link between the short and long tailed crabs, and bears a great resemblance to the Pagur. It dwells in deep burrows. Mr Darwin observed their habits in the Keeling islands, and found that they live on the cocoanuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is merely fabulous. Its front pair of legs are terminated by very strong heavy pincers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk, fibre by fibre, from that end in which the three eyes are situated, and then hammers upon one of them with its heavy claws until an opening is effected. It then, by its posterior pincers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates surprising quantities of picked fibre of cocoanut husks, on which it rests as on a bed. Its habits are diurnal, but every night it is said to pay a visit to the sea, perhaps to moisten its branchiæ. It is very good to eat, and the great mass of fat accumulated under the tail of the larger ones, sometimes yields, when melted, as much as a quart of limped oil. They are esteemed great delicacies, and are fattened for the table. —*Darwin, Hartwig Bismore, 149*

**COCOANUT DAY** occurs on the full moon of the hindu month, generally falling in August. Crowds assemble in their gala dresses, a brahmin advances into the sea and throws a gilded cocoanut into the water, on which the assembled multitude follow his example. At Porebander, in Guzerat, the brahmins bless the cocoanuts and stain them with a vermilion paste. —*Mrs Ellwood*

**COCOANUT, DOUBLE** The double cocoanut of the Seychelles or Mahe islands, is the fruit of the *Lodoicea Seychellarum*. When preserved whole, and perforated in one or two places, the nut serves to carry water, and some of them hold six or eight pints, and by slicing them in different directions they are formed into plates, dishes, drinking cups, &c known in the French islands as *Vaisselle de l'isle Praslin*. The half of a double cocoanut is a favourite scallop of the mahome

dan fakir in India. The crown of the trunk is eaten like the American cabbage palm. The down attached to the young leaves serves for filling mattresses and pillows, the ribs of the leaves and the petioles are fabricated into baskets and brooms and the young leaves are plaited to form hats. The *Lodoicea* attains a height of eighty or ninety feet. It might be largely introduced into India with advantage. Germinating nuts were sold in London in 1854 at £10 a piece. —*Seeman*

**COCOANUT MILK** is made from the kernel. For this purpose the kernel is grated, a little warm water is poured over it, and the liquid is then poured through an open cloth. This milk is excellent with coffee, and is indispensable for curries.

**COCOANUT OIL** Oil of *Cocos miferia*

Narel la tel	HIND	Kalambir	MAIA
Mmak Nui	MALAI	Tengra jenne	TIV
Mmak, Kalapa	„	Tenkala nuur	TII

The native method of making this oil is very simple. The kernel having been removed from the shell and dried, is subjected to pressure in a mill, and the oil is expressed, but when prepared in small quantities, the kernel is boiled in water, for a short period, it is then pounded in a mortar, taken out and pressed. The *milk*, as it is called, which exudes, is then boiled over a slow fire, when the oil floats to the top, and being skimmed off is afterwards boiled by itself. Two quarts of oil may be procured from fourteen or fifteen cocoanuts. When fresh, the oil has an excellent flavour. It is used as an unguent on the bodies of the natives after bathing, and as an oil for the lamp. It is employed as a lamp oil, and is manufactured into soap. It is said to have all the virtues of cod liver oil. The purest oil is obtained by grating the kernel, and depositing it in some hollow vessel, to expose it to the heat of the sun during the day, and the oil drains away through hollow spaces left for the purpose. The Malabar method of making the oil is by dividing the kernels into two equal parts, which are ranged on shelves made of laths of the betel nut palm, or split bamboo spaces of half an inch wide being left between each lath. Under these, a charcoal fire is lit and kept up for two or three days, in order to dry them, after which they are exposed to the sun on mats, and when thoroughly dried are subjected to pressure in an oil press. The remains of the cocoanut, from which the oil has been extracted, (*Posnakkull, Hind Tenga Poonak, Tam Tenga Pindee Tel. Poonnak, Sing*) affords an excellent material for feeding pigs, poultry, &c, and the best is obtained when the oil is extracted by pressure. The average annual quantity of this oil exported

from Madras from 1847-48 to 1852-53 is about galls 900,000 per annum. Of this by far the largest portion is sent to Great Britain and France, the remainder finds its way to Arabia, Mauritius, Bombay and the Indian French Ports. The prices of this oil vary considerably in different parts of Southern India. In 1854 the max and min were Rs 8 5-4 at Jubbalpore, and Rs 1-12-9 at Mhow per maund. The average of twenty-one large stations in the Madras Presidency giving Rs 4 9-5 per maund, or about £41 2 per ton. The market-value of "Cochin oil" in London (in 1855) was £46-10—the average being £46 to 48. The best oil is that exported from Cochin, and the neighbouring ports on the Malabar coast. It usually fetches 20s. per ton more than the Ceylon or Coromandel coast article. In Europe it is used for the candle and soap manufacture, for lubricating machinery, &c. In India, for making soap, anointing the person, for cookery, lamps, and in medicine.

About the middle of this century, and in late years in Ceylon, European capital and skill were brought to bear upon this produce but with no advantage to the speculators. The ordinary yield of a good tree in full bearing is 50 coconuts yearly, many trees on European lands produced from 150 to 200 per annum. For the European market the tree is only available as producing coir, fibre, and rope from the outer husk of the fruit, and cocoanut oil from the kernel when dried in the sun. The total shipments of all sorts have lately been about 30,000 to 40,000 cwts to Europe, and 20,000 cwts to the continent of India and colonies. The manufacture of cocoanut oil for shipment to Europe has only been carried on since the year 1830, although long previously made by the natives for their own use. The bullock mill employed by them to crush the nut and express the oil is of the rudest make and has remained unimproved for the last 500 years—a good description of it may be seen in Davy's Account of Ceylon. The first steam oilmills and hydraulic presses were erected by the Government in 1829, and when found to work well, and the article had become known and valued in Great Britain, the establishment was sold to private parties. This oil has ever since assumed an important place amongst the exports of Ceylon. In 1849, the quantity shipped to England was 512,457 gallons, in 1850, 791,791 gallons, and in 1851, 322,500 gallons. The imports of cocoanut oil into England was in 1853, 164,196 cwt, most of which was the produce of India, and in the year 1850-51, 649,152 gallons of the oil were exported from Malabar alone, principally to the Mauritius, Britain,

and Bombay. It is this oil which forms the foundation of Price's patent candles. Cocoanut oil becomes solid at about 70° Fahrenheit, it is one of the fixed or fatty oils, and consists of solid and fluid constituents the latter or oleine, being separated by pressure from the solid parts, called stearine, or by others Cocain, so largely used in the manufacture of the stearic candles by Mr Wilson of Vauxhall. It is also much used by soap and pomatum manufacturers. In Borneo the only oil used by the women in the dressing of their hair is that freshly expressed from the cocoanut and this is perfumed by allowing the flowers of various plants to remain in it (*Low's Sarawak*, p 145). The native oilmill is one of the oldest machines in the world, exactly similar in shape to the mortar and pestle of the druggist, the form being worked by a shaft, to the end of which a pair of bullocks are attached. The cattle travel in a circle of about 18 feet diameter, and make three complete revolutions in a minute. Half a hundred weight of copra, as the dried kernel is called, is a charge for a full sized checkoc, and a pair of stout well-fed bullocks will get through four such charges in a day, so that twenty mills are required to get through two tons in the twenty-four hours. The man who drives has usually a boy to assist him in taking the oil, which is got out of the mortar by dripping a piece of rag into the fluid and squeezing it into an earthen vessel. It is not the purest and brightest of liquids as may well be imagined. The cost of the native oilmill with serviceable bullocks, is rather under than over £20. The wages of a man and boy to each mill are fifteen pence, and a pair of bullocks fed luxuriously, entail a daily cost of one shilling more. There are no other expenses, and the total amounts to £7 55—*M. E. J. Report Cal Rev No 73 Sept 1861*, p 153 *Low's Sarawak*, p 145.

**COCOANUT TODDY** The cocoanut trees of vigorous growth send forth nine, ten, and even twelve clusters of buds every year. But those on which little care has been bestowed, and which are consequently feeble, produce only four or five of these spathes. When a tree has thrown out a spathe (called in Tamil "palar"), from which it is intended to extract toddy, about a month is usually allowed to elapse for the flower buds inside the spathe to become sufficiently juicy to yield a fair return to the toddy-drawer. The spathe, at that time elliptical in form and pointed, will have attained a length of two feet, and a diameter of about two inches in the thickest part. The sheath of the spathe will be about an eighth of an inch thick, and very hard. At this stage the nut

is a small, round looking knob, of the same colour as the flowers, pale yellow, and of about the size of a marble. A few of the spathe are barren of nuts, some of them contain two or three, some five or six, and others as many as ten or twenty. When a month or five weeks have elapsed, and the spathe is considered in a fit state to commence operations upon, it is tightly bound round with strips of young leaves, to prevent the expansion of the sheath, and is cut transversely at the point, bruised, and otherwise carefully treated from day to day. To do this is the business of the "Sanar" or toddy-drawer. A "Sanar," when accoutred, has, first in importance among his appointments, the "Aivalpatty" (lit knife box) made from the sheath of the spathe, and bound round tight with two binders of rattan. A strongly plaited rope is permanently fastened to one side of the "aivalpatty." The short arm of it has a much smaller loop, when fastened round the waist, the longer arm is passed inside the small loop of the short arm. Through the loop of the long arm the toddy-drawer passes the end of his waist cloth, and ties it into a knot. Next in importance is the "Erapetty," into which the toddy-drawer empties the toddy collected in the pot or "chatty" up the tree. It is made of palmyra fibre closely plaited, and when moistened, is water-tight. Two wooden collar shavings, about two inches broad, encircle the mouth of the eropetty, one inside and one outside, between them the plaited wicker-work is run up, and made fast. To keep the "eropetty" in its bulged bottle like form, a piece of rattan about halfway down is woven in, and encircles the vessel like loop of a barrel. The "eropetty" hangs suspended over the loop of a barrel. It takes nearly a year's practice to make a man master of the curious mode of climbing, after which the loftiest trees are ascended in a minute with surprising ease, and with perfect security. After a hard morning's work, the left arm always aches more than the other limb, showing that there is more strain on it than anywhere else. When an accident befalls a toddy-drawer, it is usually occasioned by his left hand missing its hold on the tree and slipping aside, which brings him to the ground instantly, often with fracture or injury of that limb.

When the spathe is a month or a month and a half old, the toddy-drawer begins his labours by binding the sheath to prevent its expansion, after which he cuts about an inch off the end, then gently hammers the flowers which are thereby exposed. Finally, he binds up the end with a broad strip of fibre and descends. This process he continues morning

and evening for fifteen days, a thin slice being cut away on each occasion. During this time, also, by shaving away a little of the under part of the sheath, he trains it to bend over. It is probable that the exact term of days during which the spathe undergoes this initiatory preparation varies in different places, and depends upon surrounding circumstances. Mr. Berthold Seeman, in his "Popular History of Palms," mentions five or six days as sufficient. Near Madras, a toddy drawer gave us fifteen days as the usual time, but the time when a spathe is ready to yield toddy will be easily known by the chattering of birds, the crowding of insects, the dropping of the juice, and other unmistakeable signs. When ready, the end of the spathe is fixed into a "Kudave" or small pot, and a small slip of leaf is pricked into the flowers to catch the oozing liquor, and to convey the drops without wasting, clear into the vessel. When the spathe begins to yield toddy, he ceases to hammer it. It will give toddy for about a month, during which time, every morning and evening, he mounts the tree, empties the toddy into his "eropatty," binds the spathe an inch lower down, smears the end of it with his "palai mattai," and shaves a little away, then pricks in the slip of leaf, and ties the "kudave" on again. The man who ascends the tree is generally a paid servant, receiving about Rs. 7 a month. He will attend to thirty or forty trees. Forty trees yield about twelve measures (Madras) of juice, seven in the morning and five in the evening. During the heat of the day the spathe does not yield so freely as in the night. Twelve measures for forty trees is at the rate of a little more than one fourth of a measure to each tree. A first rate tree in a good soil, and carefully tended, will produce one measure during the night, and three-fourths or one-half of that quantity during the day. But taking one tree with another, a quarter of a measure is a fair average. Some trees, under favourable circumstances, continue yielding at this rate throughout the year, others only for six months. It is not prudent, however, to draw all you can from them, as they will be exhausted, and become barren. Every morning and evening, when the Sanar goes to draw the toddy, a servant or some one connected with the owner or contractor for the trees usually accompanies him with a chatty, into which is emptied the toddy from the "eropatty." When all the trees have been visited, and the toddy measured into the chatty or "cullu-pani," it is carried away to the bazaar rented by the contractor from Government at a fixed price. In Madras, there are 58 first-class toddy shops,

to each of which 330 cocoa nut trees are allotted, the contractor paying daily Rupees 2-12-10 to Government for each such shop. There are 63 second-class toddy shops, to each of which 247 cocoa nut trees are allotted each shop yielding daily Rupees 2-2-10 to Government also 205 third-class shops. There is nothing very peculiar about the habit, custom, or dress of the "Sanars" to separate them from other hindu castes, apart from their occupation, which, being exclusively that of the sale and manufacture of toddy, may be said to distinguish them. Around Madras the Sanars are divided into two classes, the higher and the lower, the latter are called "Pully Sanar," and permit their widows to marry.—*Dr Cleghorn, in No 23 Edinburgh New Philosophical Journal, New Series, Vol XIV No 11, October 1861, p 183*

**COCOS, or EDDOES** The root of *Arum esculentum*. The labouring population of the West Indies largely depend for a supply of food on this root. Long droughts may disappoint the hope of the yam crop, storms and blight may destroy the plantain walks, but neither dry or wet weather materially injure the coco, it will always make some return, and will yield a sufficiency until a supply can be had from other sources. The laborer in the West Indies always takes care to put in a good plant of cocos into his provision ground as a stand-by. Previous to their emancipation, whole families of negroes lived upon the produce of one provision ground, and the coco formed the main article of their support. Where the soil is congenial to the white and black Bourbon coco, the labour of one industrious person once a fortnight will raise a supply sufficient for the consumption of a family of six or seven persons. The coco begins to bear after the first year, and with common care and cultivation the same plant ought to give annually two or three returns for several years. Another species, the Taro (*Arum colocasia*, *Colocasia esculenta* and *macrorhizon*), is an important esculent root in the Polynesian islands. In the dry method of culture practised on the mountains of Hawn, the roots are protected by a covering of fern leaves. The cultivation of taro is hardly a process of multiplication, for the crown of the root is perpetually replanted. As the plant endures for a series of years, the tuberous roots serve at some of the rocky groups as a security against famine. It is also extensively cultivated in Madeira and Zanzibar, and has even withstood the climate of New Zealand. It is grown also in Egypt, Syria, and some of the adjacent countries for its esculent

roots. A species is cultivated in the Deccan, for the sake of the leaves, which form a substitute for spinach. Farina is obtained from the root of *Arum Rumphii* in Polynesia.—*Simmonds, p 364*

**COCOS DE MER** Fr The Lodoicea Seychellarum palm, found exclusively on three of the smallest of the Seychelles,—Praslin, Curieuse, and Round island, lying south of the equator. It produces the huge double cocoanut, formerly supposed of such wonderful medical virtues that £150 was given for a single nut. It is also called "double cocoanut," also "Vaiselle de l'isle Praslin double." See Cocoanut, Double, Lodoicea. Sea cocoanut.—*Chambers' Edin JI, July 1852, 405.*

**COCOS INDICA** See Elæis

**COCOS** Fr Sp Cocoa-nut palm.

**COCOS** There are three groups of islands known by this name, one called by Captain Ross, Keeling, one near the Great Andaman, and the third near Hog Island, off the west coast of Sumatra.

The Cocos, in lat 3° 6' N and long 95° 30' E, on the west coast of Sumatra, are two small islands covered with trees.

The Cocos or Keeling Islands, south of Java, lie in two distinct divisions north and south of each other. The channel between the two is 15 miles broad, the northern division consists of one island only, in lat 11° 49½' S, and long 96° 51' E, but the islets in the southern one are numerous. The Cocos Islands, a few miles distant from the north-east point of the great Andaman, are two little isles. The larger of them is six miles long and two broad, the smaller two miles and a half long, and nearly a mile broad. They are sheltered by the Andamans from the heavy south-west swell of the Bay of Bengal.—*Selections from the Records of the Government of India, Home Department, No. XXV, p 64 Horsburgh*

**COCOS NUCIFERA** L Cocoa-nut tree.

The cocoanut palm does not seem to have been known to the ancients, though it is said to be indigenous in the East, from which they received ambassadors. The first allusion to it, however, in Ceylon, is in A D 1153 in the reign of king Prakrama I, and the cocoanut is said by the hindus to have been brought by Viswamitra from Ceylon to India. It now grows in great abundance in the Maldive and Laccadive islands, on the Malabar coast, in Ceylon, on the eastern side of the Bay of Bengal, though scarce in Aracan, whence it ascends both the Burampooter and Ganges rivers to a considerable distance. It grows in the Nicobars, in most of the Eastern Archipelago from the Sunda to the Molucca Islands, and in those of the Pacific Ocean, and is now cultivated in various tropical parts of the New World. It grows to the height of 1,000 feet above the sea, though flourishing in greatest luxuriance in the vicinity of the ocean. It rises sixty to a hundred feet high, its cylindrical trunk, crowned with numerous waving, feathery, leaves, forming an elegant object of intertropical scenery. It is self-propagating. Its keel shaped nut, protected from the salt water by its tough and thick though light covering, sails on the ocean to barren spots, where it germinates and causes even the smallest islets to become covered with clumps of the cocoanut palm. The cylindrical stems, with a diameter of about

two feet, attain an elevation of from sixty to one hundred feet. They are surmounted by numerous wavy leaves, called fronds by botanists, and their foot stalks are often called branches by travellers. The leaves are gigantic in size—being about 20 feet in length, with a strong tough stalk, which forms the midrib, and has a number of narrow and long leaflets ranged along the two sides.

It is a tree of great value to the people. The wood is applied to various purposes, such as rafters, fences, shears, laths, shingles, chairs, and ladies' work boxes, &c, but during the period of its most abundant bearing (considered to be between ten and thirty-five years growth), the heart wood is of so soft and spongy a nature, that it is then merely used for fences, water pipes &c. Its wood is also used for reapers, for which purpose it is, however, inferior to the palmyra, though, in Ceylon and on the western coast, hard and durable rafters are procurable. The Cochui planks are prettily striped and of remarkable size. The wood is strong and durable, a cubic foot weighs 70 lbs, and its timber is esteemed to last for 20 to 50 years. It is used for ridge poles, for temporary roofs, aqueducts, &c, for small boats, for the beams, posts and rafters of houses, for spear handles, paling, and walking sticks for fancy boxes, and furniture, for boat's frames, bridges, ramparts, water butts, conduits, gutters and drains, it forms one of the porcupine woods of commerce, and is used for fancy articles. Astringent substance is contained in the stem, which forms a good substitute for sago. Each tree produces annually from 50 to 60 cocoanuts. These are enclosed in a thick fibrous husk, from which the coir of commerce is obtained by maceration and beating. The husk is employed as a scrubbing brush and polishing brush, it is converted into cordage of various kinds, employed for the rigging of ships, fishing nets, matting, and brushes, and, in India, in its loose state, it is the usual material with which mattresses, pillows and sofas are stuffed. Within the fibrous husk, is the shell, which is very brittle, though its structure is somewhat fibrous. Cut in various ways, it is formed into cups and drinking vessels, into pitchers, funnels, and lamps. It is susceptible of a high polish, and admits of being turned in an agreeable manner. Those shells which are tolerably circular are used for the bodies of cups and vases, the feet and covers being made of wood and ivory. Common buttons are also made of the cocoanut shell, and are considered better than those of horn, as they do not, like that material, absorb the moisture, which

causes horn buttons to swell and burst. The shell forms a valuable charcoal.

In its young and green state, the coconut contains a clear albuminous fluid, with a sweetish taste and a slight degree of astringency, which makes it a very agreeable refreshing beverage, and it is also used by house plasterers as an ingredient in their white washes made of pure lime. But, as the nut advances to its full maturity, the fluid disappears, and the hollow is filled by the almond-like dried albumen which is the germinating organ. This pulp or kernel, when young, can be easily removed by a spoon when cut in pieces and dried in the sun, it is called copra, which forms an extensive article of commerce throughout the south and east of Asia. It is used grated in curries, or its milk is expressed from it, and, from copra, a valuable oil is expressed, which is employed in anointing the body, is used in lamps, is largely converted into the stearine candles of England, and forms an invaluable substitute for cod liver oil. The refuse oil cake "Poonac" forms an excellent manure. The white and solid albumen is often cut into ornaments of flowers and fruits, meant to represent the garlands given to visitors of distinction. They are worn by Tanjore ladies at particular festivals.

The very young or heart leaves of this palm are called the cabbage, and form an excellent vegetable either cooked or dressed in stews, hashes or ragouts. In the Laccadive islands, the heart leaves of the tree, just before they unfold, are cut out and plaited into mats of fine quality which are there used as sails for the smaller boats and are much esteemed when exported. In India, the leaves dried, and called by Europeans cadjans, are plaited and used as thatch, and for the outer and inner linings of walls of houses. The leaves are also made into mats, baskets, both fancy and plain, into fans, combs, brooms, screens, buckets and lanterns, into articles of dress, and into leaf books, torches and fuel. The foot stalks of the fronds are used for fences, yokes, shoulder poles, and fishing rods. The midribs of the leaves or fronds are fibrous but brittle and are used as brooms. The roots of the tree are chewed as a substitute for betel nut.

One of the beverages known to Europeans as palm-wine or toddy is obtained from the flower spathes. Before the flowers have expanded, the spathes—and these are themselves astringent and used medicinally—are tied with the young leaves and then cut transversely from the top downwards, and beaten daily with the handle of the knife or a piece of hard wood, and the sap, after

a few days, exudes into a calabash or earthen pot. In the early morning, this is a pleasant, refreshing drink, but it ferments towards night and becomes an intoxicating fluid, which is largely drunk and is used as a ferment. It is to a great extent artificially brought to the vinous and acetous fermentations, and, in the former state, an alcoholic spirit is distilled from it, which forms one of the articles of commerce, one hundred gallons of toddy produce, it is said, by distillation, twenty five gallons of arrack. Eight gallons of sweet toddy boiled over a slow fire, yield two gallons of a luscious syrup, from which, by further boiling, a coarse brown sugar is produced, known in commerce as jaggery. The net like substance Peynadi, Tamil, "Jalla Mitti," Hind, at the base of the petiole, when very young, is delicate, beautifully white, and transparent, but when it attains maturity, becomes coarse and tough, and changes to a brown colour. Portions of these are everywhere used as strainers and sieves, for straining fluids, sifting arrowroot, &c, and the Tahitian fisherman convert it into a garment when fishing.

The flowers contain a powerfully astringent property, used medicinally, and it is from the flower and spathes, before the flower has expanded, that the toddy or palm-wine of this tree is obtained. The Tahitians extract a gummy substance, called Pia Pia, from the trunk of the tree. It may perhaps enable an estimate to be formed of the value of this palm by furnishing the following statement of the exports and imports from and into India of the products of the cocoanut palm, during the year 1850-51.

A western poet, writing of the cocoanut, has justly said—

" \* \* \* the Indian's nut, alone,—  
Is clothing, meat and trencher, drink and can—  
Boat, cable, sail and needle, all in one "

In Malabar and Ceylon every available spot within the influence of the sea breeze is being devoted to the growth of the cocoanut. Along the western coast of the Madras provinces, the wavy downs near the

sea-borders, which have hitherto produced only a stunted and worthless crop of grass, are being everywhere levelled, broken up and manured, so as to form the beds of future plantations. Cocoa-nut trees have great enemies in the shape of two beetles. One of these is a large *Curculio* (*Rhynchophorus* *Sach*) called the red beetle, nearly as big as the Stag beetle of Britain, the other is the *Oryctes rhinoceros*, so called from its projecting horn. The red beetle is so called from the red mark on the upper part of its breast. Its attacks are said to be on the nut, but those of the rhinoceros beetle are on the terminal bud of the palm stem. When so injured, the bud dies, and the crown of the leaves falling off, leave the cocoa-nut tree a mere bare stem. The same result occurs to other palms, the palmyra, the betel, in which the top bud, or cabbage as it is called, is destroyed.—*Collingwood Simmond's Commercial Products Royle's Fibrous Plants Madras Exh Jury Reports Secman on Palms Ainslie's Materia Medica Madras Lit Soc Journ English Cyclopædia Elliot's Flora Andhrica Cal Review Malcolm's Travels in South Eastern Asia, VI p 176*

**COCUM OIL**, or butter, is obtained from the seeds of a kind of mangosteen (*Garcinia purpurea*) and used in various parts of India to adulterate ghee or butter. It is said to be exported to England for the purpose of mixing with bear's grease in the manufacture of pomatum. It is a white, or pale greenish yellow, solid oil, brittle or rather friable, having a faint but not unpleasant smell, melting at about 95 degrees, and when cooled, after fusion, remaining liquid to 75 degrees.—*Simmonds*

In China, the consumption of salted provisions is very general, and also, in consequence of the immense quantities of both sea and river fish which are caught, and the rapidly putrescent nature of that species of provision, a considerable portion is cured with salt and dried in the sun, the haut gout which accompanies it being rather a recommendation to

the taste of the Chinese. Indeed it is one of their most favorite, as well as generally used articles of food, and they even overcome their prejudice or indifference for whatever is foreign, on the occasion of salted cod being introduced for two or three years in English ships, the somewhat decayed condition in which it reached China being said to have been any thing but a drawback. This species of cargo, besides its disagreeable nature and the injurious effect which it might have on some delicate articles of shipment, was found during the voyage to breed a peculiar insect, which from the readiness with which it bored into the planks and timbers of a ship, was considered as dangerous, and accordingly the import was greatly discontinued.—*McCulloch's Commercial Dictionary, p 302 Morrison, Compendious Summary*

**CODO** *HIND* *Paspalum frumentaceum Kæn* A small grain, sown early during the rainy season. This grain frequently has inebriating properties, when made into bread. Such Codos known by the name of Mutouna, from Mutt, drunk, intoxicated. In appearance it resembles ordinary Codo. It is sown as ordinary Codo, and comes up as Mutouna, but only in those fields on which Codo has been previously grown, and even in such case, only perhaps in one instance out of ten. These curious properties of Codo have invested it with a degree of mystery in the eyes of the natives of India, and some classes even worship it as a god. Thus, the Kakau rajpoots of Ghazeepoor are said to pay worship to this divinity. They never cultivate or eat Codo,

"Nefas violare et frangere morsu,"

and the reason assigned is that, while under the influence of Mutouna, they were set

upon by some of the neighbouring tribes, and thus lost the greater part of their once extensive possessions "Kisarec" (*Lathyrus sativus*) is another grain which is found to have injurious properties — *Elliot*

COELAGOERYP, a race in Cochín who make bows, arrows, shields and other weapons. The Cannimargocryp are a race whose vocation is to teach the art of fencing and the use of weapons, the Coelady are trumpeters

CÆCILIIDÆ, a family of reptiles of the order Batrachia apoda, family contains two genera, *Cæcilia oxyura*, Delect B, which is found in Malabar, and the genus *Epicrion* of which *E. glutinosum*, Linn, is found in Ceylon, and *E. monochroum*, Blecker, in Pegu. These very singular reptiles were first introduced to the notice of European naturalists in the middle of the 18th century by Linnæus, who gave to the Ceylon species the name *Cæcilia glutinosa*. This is an inch in diameter and nearly two feet in length. Its eyes are so small and imbedded as to be undistinguishable to ordinary observers, who believe the reptile to be blind. Like snails, eels, and some salamanders, it secretes a viscons fluid from minute pores in its skin. The skin is furrowed into 350 circular folds, in which are imbedded minute scales. The head is tolerably distinct, with a double row of fine curved teeth for seizing the insects and worms on which it is supposed to live — *Sir J F Tennent, p 318* See Batrachia

COEL HIND A bird of the class Aves, of the family Cuculidæ, Order in Insessores. It is the Endymis, or Cuculus orientalis, and inhabits Ceylon, India, Malay countries and China, and is called Coél, HINDI "Kokil," BENG, "Chule," MALAY, and "Cowde coha," SINGH, all of which are obtained from its ordinary call, which closely resembles the word "koil." Like the cuckoo of Europe, this is, in India, the harbinger of spring, and its call, though shrill and disagreeable, is associated with all the joys and labours of husbandry of that season, and is quoted in the rhymes and proverbs of the people. Thus "Coel boleç, Sebundee dolee," the cry of the coel is the grief of the se-bundy soldier, meaning that the disbanding of the armed men gathered together for collection of revenue depends on the coel's note. Sebundee being a corruption of Sipah Hindee, in distinction to Moghul or foreign troops, who were always kept up. The coel indeed occupies much the same place in India that the cuckoo does in Europe. The European names, even, are all derived from the Sanscrit name Cuculus. Pliny says that the vine-dressers deferred cutting their vines till the cuckoo began to sing. There is the Cuckoo-

Ale of England, which the labourers leave then work to partake of, when the first cuckoo's note is heard. There is also the vulgar superstition that it is unlucky to have no money in your pocket when the first cuckoo of the season is heard, and the amorous Hobnchia tells us, that in love omens its note is equally efficacious — *Elliot*

CÆLUS See Kama

COENTRO Port Coriander seed

COEPANG A Dutch Settlement in the Island of Limor

CÆLEBOGYNE A genus of plants belonging to the natural order Orchnaceæ. The most gaudy of the plants of Borneo are perhaps the various species of Cælogyne, called collectively by the natives the 'bu-nga kashan,' or the flowers of merey, their white and orange coloured flowers are exceedingly delicate and beautiful, and they are all highly fragrant. Voigt enumerates about twenty species, at the foot of the Himalaya, Nepaul, the Khasya hills and China, namely—

angustifolia	gardeniana	ovalis
barbata	interrupta	piæcox.
cristata	longicaulis	procera
decora	maculata	prolifera
clata	media	rigida
fimbriata	nitida	undulata
flavida	ocellata	wallichiana

CÆLOPS A genus of the Mammalia, of the sub-family Rhinolophinæ, of the sub-order Chiroptera or bats. the families, sub-families, with the genera and numbers of species, are as under —

Sub-order—Chiroptera	Bats
Fam —Pteropodidæ	Frugivorous Bats
3 Gen —Pteropus,	4 sp

The Coffee tree is supposed to be indigenous to the mountain regions of Enarea and Cuffa to the south of Abyssinia, whence, about the fifteenth century it was introduced into Arabia, into Mauritius and Bourbon in 1718, and Batavia in 1723, and subsequently into the West Indies. It is one of the most valuable of the plants which have been distributed by man. Its large, pure white, sweet scented flowers appear in March, April and May, and it fruits in November, December and January. Its fruit, known as the coffee berry, contains an active principle called caffeine, which has been found to be identical with theine, and a decoction of the roasted berries or an infusion of the berries is a well known article of diet. At present, decoctions or infusions of coffee, tea, cocoa, matao, Paragnay tea, guarana and kola nuts, constitute the beverages of the European, American, Asiatic and African peoples. These have been selected by an unerring instinct which has divined in each plant the remarkable alkaloid theine. Different in botanical characters, varied in genera, not very unlike in flavour, they all contain this valuable active principle. The theine in dried kola nuts is about 2 per cent, coffee has 0.5 to 2.0 per cent, and tea from 0.5 to 3.5 parts in 100. The coffee berry consists almost wholly of albumen, which surrounds the small embryo of the seed, coffee in infusion or decoction is a stimulant. *Coffea Arabica* thrives plentifully in the Dutch Archipelago, at Minahassa were nearly six millions of trees, each tree producing annually a pound. *McCulloch*, *Waring*, *Royle*, *Budwood*, *Vogt*. *Journ. Ind. Arch.*

## COFFEA MAURITIANA LAM

*C. mytilifolia*, *Rorb* | *Cafe' Marron*, *FR*

A plant of the Mauritius, Bourbon — *Vogt*

COFFEE PLANTING, as a branch of agricultural industry, has only been introduced into India in comparatively recent times, but it has attracted many persons, and in Ceylon, in the south of India, in Coorg and Wynaad, on the slopes of the Neilgherry hills, and on the Shevaloy Hills, the expenditure in forming coffee estates, may have amounted, up to 1870, to about twelve millions sterling. A portion of that amount was wholly lost, on another portion the returns have been unremunerative. There have been large sums made by land speculations, and several estates have paid a handsome interest, but both in Ceylon and Southern India, the losses have been considerable, often ruinous. In the Netherlands India, the coffee planting has been a government monopoly, and there has been a very large exportation of coffee from Java and the Celebes, but the most recent information is to the effect that the monopoly is not, or is but little, remunerative. The native country of the useful plant, the *Coffea Arabica*, seems to have been the highlands of Abyssinia. Col Playfair tells us that Abd el Kadir Mahomed el Azari el Jeziri el Hanbali, who wrote in Egypt about A. D. 1587, relates that in the middle of the 15th century, Jemal ed din Abu Abdulla Mahomed bin Saeed ed Dubani was kadi of Aden, and having occasion to visit Abyssinia, he found his countrymen there drinking coffee, and on his return to Aden introduced it, whence it passed into Arabia generally, and into Mecca, Egypt, and Europe. Sheikh Ah Shaduli bin Omai settled near the sea about A. D. 1630, on the plain now occupied by the town of Mocha, and his reputation drew people around him till a village was formed. He greatly recommended the use of coffee, and he has ever been regarded as the patron saint of Mocha, the people having, on his demise, erected over him an elegant tomb. In *Everard's Treatises* (p 64) *Tavernier* seems to be quoted as remarking that "Coffee grows neither in Persia nor in India, where it is in no request, but the Hollanders drive a great trade in it, transporting it from Oimus into Persia, as far as Great Tartary, from Balfara into Chaldea, Arabia, Mesopotamia, and the other provinces of Turkey. It was first found out by a Hermite whose name was Sheck-siadeli, about twenty years ago, before which time it was never heard of in any author either ancient or modern." From that time small quantities have been grown in Ceylon and India, for a very limited local consumption, but it is to the British

that the world generally are indebted for its great extension in India

*Cultivation in Arabia*—In Arabia Felix, the culture is principally carried on in the kingdom of Yemen, towards the cantons of Aden and Mocha. Although these countries are very hot in the plains, they possess mountains where the air is mild. The coffee is generally grown half way up on their slopes. When cultivated on the lower grounds, it is always surrounded by large trees, which shelter it from the torrid sun, and prevent its fruit from withering before their maturity. The harvest is gathered at three periods, the most considerable occurs in May, when the reapers begin by spreading cloths under the trees, then shaking the branches strongly, so as to make the fruit drop, which they collect and expose upon mats to dry. They then pass over the dried berries a heavy roller, to break the envelopes, which are afterwards winnowed away with a fan. The interior bean is again dried before being laid up in store. The principal coffee districts are Hengiersia, Tarzia, Oudein, Aneizah, Bazil, and Weesaf. The nearest coffee plantations are three-and-a-half days journey (about 80 miles) from Aden. Captain S. B. Haines, Indian Navy, formerly political agent at Aden, mentions that

A camel load is about 400 lbs = 25 frazla or bales

	G C Commasseees	
The price of ditto inland	31	41
A Mocha duty to Dewla uncertain		
Bake fee one butsha on each frazla,		25
Weighing and clerk's fee		20
Packing		40
Camel hire to the coast	12	50
Cost from Sana to Mocha	44	45

Coffee is brought into the Sana market in December and January from the surrounding districts. The varieties are—

- 1 Sheizee best—price 1 G C frazla 25 butsha
- 2 Ouceume
- 3 Muttanee
- 4 Sharrazee
- 5 Hubbal from Aniss
- 6 Sheissees from ditto—price per frazla 1 GC 15B

The nearest place to Sana where the coffee tree grows, is at Arfish, half a day distant. Attempts have been made to introduce the shrub in the garden of the Imaum at Sana, but without success, ascribed to cold. Keshir is more prized at Sana, best is Anissea, and is sold at a higher price than other coffee, namely, g c 12 per 100 lbs, inferior, at from 4, 5, and 6. Rain falls in Sana three times in the year. 1st In January, in small quantities. 2nd Beginning of June, when it falls for eight or ten days. By this time the seed is sown, and the cultivators look forward to the season with anxiety. 3rd. In

July, when it falls in abundance. A few farmers defer sowing till this period, but it is unusual, when they expect rain in June. The coffee plant is mostly found growing near the sides of mountains, valleys, and other sheltered situations, the soil on which has been gradually washed down from the surrounding heights, being that which forms its source of support. This is afforded by the decomposition of a species of claystone (slightly porphyritic), which is found irregularly disposed in company with a few pieces of trap-rocks, amongst which, on approaching Sana from the southward, basalt is found to preponderate. The clay-stone is only found in the more elevated districts, but the debris finds a ready way into the lower country by the numerous and steep gorges which are conspicuous in every direction. As it is thrown up on one side of the valley, it is carefully protected by means of stone walls, so as to present to the traveller the appearance of terraces. The plant requires a moist soil, though much rain does not appear necessary. It is always found in greater luxuriance at places where there is no spring. The tree at times looks languid, and half withered, an abundant supply of water to the root of the plant seems necessary for the full growth and perfection of its bean. Mr Palgrave says the best coffee is that of Yemen exported from Mocha, but Arabia, Syria and Yemen consume 2/3 of it, and the other third finds its way to Europe to the west of Constantinople and is used by Turks and Armenians. The rounded, half transparent, greenish brown berries are the best. It is also exported by the Red Sea into the Hejaz and Kaseem in Shimer. The Abyssinian coffee berry also excellent is inferior in qualities to that of Yemen, it is larger. The Indian berry ranks next. In Arabia, the picked berries are roasted in a ladle until they crackle, reddened and smoke a little, and are carefully withdrawn from the heat long before they are black or charred, and are then put to cool on a glass platter. They are then bruised (not powdered) in mortars, poured into hot water, and boiled gently and not long, all the time stirring with a stick, add when boiling a few aromatic seeds, 'Heyl,' and a little saffron and cloves. The liquor is then strained.

*Ceylon*—When Ceylon became a British possession, it was considered as valuable only for its pearls and spice, at the present time, the pearl fishery of the island has ceased to be productive, whilst the trade in cinnamon has sunk into an almost profitless speculation. Coffee is now the great staple of this island, and deservedly ranks first on account of the money value of the yearly exports, not less

than the great number of persons, both Europeans and natives, to whom it affords a regular employment. The yearly crops in 1852 amounted to 300,000 cwt. The coffee tree was introduced into Ceylon by the Arabs before the arrival of the Portuguese, but the Singhalese only employed its tender leaves for their curries, and its delicate jasmine-like flowers for ornamenting their temples and shrines. The Dutch carried the coffee tree to Batavia in 1690, and about the same time they began its cultivation in Ceylon, but again ceased in 1739. Its culture, however, continued to be prosecuted by the people, and after the British occupation, the mahomedans collected it in the villages, and brought it to Galle and Colombo, to be bartered for cutlery, cotton and trinkets. It was extensively diffused over the country by the agency of birds and jackalls. In 1821, its cultivation may be said to have partially commenced, and in 1836, it had become widely extended through the Kandyan provinces. In 1839 not a tree had been felled on the wide range of the Himasagara mountains. In 1840 a small plantation was, for the first time, formed. In 1846 there were fifty estates there, averaging each 200 acres of planted land, and yielding an average crop of 80,000 cwt of coffee. After 1830 the quantity of coffee shipped to England yearly increased, although it still consisted entirely of the native grown, badly prepared berry, reared without any attempt at cultivation, and ranking below almost every other kind of coffee. In 1830 the first attempt at coffee cultivation and curing was made on a considerable scale by the governor of the island, Sir Edward Barnes. The success which attended this experiment, although partial, added to the lowering of the import duty on British East India coffee by the imperial legislature in 1835, induced several merchants and others to apply for waste forest land, for the cultivation of coffee on the West Indian principle. During 1836 and 1837, upwards of 7,000 acres of crown lands were purchased, and partly cleared and planted, and in 1836 the crop was 60,330 cwt. The success of these first operations drew many capitalists to Ceylon for similar purposes, and the land sales, which in 1838 amounted to 10,000 acres, grew to 78,000 acres in 1841. By the end of 1847, when fresh operations had ceased, about three millions sterling appear to have been invested in coffee planting in this island chiefly by Europeans. The number of plantations formed was 330, the majority of which contained from 120 to 300 acres of cultivated coffee. The total acres brought under this culture up to 1849, were 50,840, of which, however, several thousands had

ceased to be productive. These estates are situated at a great variety of altitudes, ranging from 1,000 to 4,500 feet above the sea level. In 1839, the export was 41,863 cwt. In 1849, the total export was 387,526 cwt, value £156,663; they rose to 601,655 cwt, value £1,455,019 in 1859. With the increase of coffee growing in Ceylon, the decrease in the production in the British West Indies, has been simultaneous.

Year	Imported into United Kingdom from the West Indies lbs	Exported from Ceylon lbs
1827	22,419,598	1,792,448
1837	15,577,885	6,756,848
1847	5,259,119	19,475,904
1857	1,051,028	67,153,650

In Ceylon, in 1859, on 404 coffee estates, the area yielding coffee was 130,000 acres, and that planted but not yet bearing was 17,179. The number of coolies employed was 129,200, and the produce on an average of the two previous years was 407,100 cwt of coffee, averaging 3½ cwt the acre. The value of the coffee exported had risen from £107,000 in 1837 to £1,296,736 in 1857.

The upland coffee farm formed by Sir Edward Barnes in 1825, was at Gangaroor a near Paladenia, and from that year then commenced progress which converted a sluggish military colony into an active commercial county, and transferred the supply of coffee from the West to the East.

At page 107 of the Calcutta Review for 1857, was given the following as about the production of coffee throughout the world —

## IN THE WEST

Brazil,	300 millions of lbs
La Guayra and Porto Cabello,	30 "
St Domingo,	32 "
Cuba and Porto Rico,	25 "
Costa Rica,	10 "
British West Indies,	6 "
French and Dutch ditto	6 "
	409

## IN THE EAST

As a rule, good coffee cannot be profitably grown in Ceylon at a less altitude than 2,500 feet, the most favourable height being from 3,000 to 3,500 feet. The best plantations are situated in the Kandian province, where the thermometer ranges at noon about 76, and in the morning not higher than 60. The principal drawback to the success of these properties has been the absence of roads in many directions, compelling the planter to convey his half dried crop on the heads of coolies, or on the backs of bullocks, for a distance of 25 to 35 miles, before finding any carriage transport. The dampness and coolness of the hill climate renders it impossible to perfectly cure the coffee berry in those elevated regions, it has therefore to be conveyed to Colombo, where a constant high temperature enables the merchant to complete the drying process, which the planter had but commenced. In 1866—7, 837,231 cwt of coffee were exported from Ceylon, of which 200,129 were grown by natives. Its annual export of cinnamon is lbs 819,851, of cocoanut oil cwt 109,557, of plumbago cwt 50,711, of cor 38,543, of ebony cwt 21,582, and of deer horn cwt 8,501. Of the Ceylon coffee, that grown about Ramboddi fetches the highest price, from the superiority of the make, shape, and boldness of the berry. The weight per bushel, clean, averages 56 lbs, 57½ lbs is about the greatest weight of Ceylon coffee. The lowest in the scale of Ceylon plantation coffee is the boombora, which averages 54½ lbs, clear, per bushel. The prices of good ordinary Ceylon coffee in the port of London for the eight years 1846 to 1856 in the month of January 1853, 46s to 48s, 1852, 40s to 42s, 1851, 38s 6d to 40s 6d, 1850, 56s 6d to 57s 6d, 1849, 31s to 32s 6d, 1848, 31s 6d to 33s, 1847, 39s 6d to 41s 6d, 1846, 49s to 50s. Forest lands were those usually planted in Ceylon, and the expense attendant on clearing and reclaiming them from a state of nature, and converting them into plantations, is estimated to average £8 per acre. Coffee planting however failed over a considerable portion of the southern province of the island, where the experiment was tried. The temperature was found to be too equable, not descending sufficiently low at any time to invigorate the plant, which, though growing luxuriantly at first, soon became weak and delicate. The districts in which the coffee is principally cultivated, extend over nearly the whole of the hilly region, which is the medium and connecting link between the mountainous zone and the level districts of the coast. To the height of 3,000 feet the chief crop ripens in October and November,

and a small second gathering is looked for in May. As regards the yield, some estates in Ceylon have produced upwards of 15 cwt per acre, but it is a good estate that will average seven, and many do not give more than 4 cwt the acre. About the year 1842, there was a great rush into the coffee planting of Ceylon, and much money was lost. The magnitude of the "Coffee Mania," and the rapidity with which it spread may be judged of from the following figures. The quantity of hill forests available for the cultivation of coffee, sold by the Government up to October 1846 (since which scarcely any land has been sold), was 287,390 acres. Previous to January 1841 very little land had been disposed of. Of this vast tract of private property, we find by official returns that on the 31st December 1847, there were 50,070 $\frac{3}{4}$  acres cultivated, of which 25,198 $\frac{1}{4}$  were planted previous to the 31st December 1844, and the remaining 24,872 $\frac{1}{2}$  in the three following years. The gross cost of this is said to have amounted to the enormous sum of £5,000,000 sterling. There has also been great loss of life amongst the labourers. The Kandians and the lowland Singhalese were found unsuitable for the work, besides being too few, and there was a large importation into Ceylon of labourers. The arrivals at and departures from the ports of Ceylon of Tamil coolies, from 1841 to 1848 were—

Years	ARRIVALS			DEPARTURES		
	Men	Women	Children	Men	Women	Children
1841	4,523	363	164	4,243	274	117
1842	9,025	279	166	10,691	345	228
1843	6,298	162	248	18,977	194	482
1844	74,840	1,181	724	38,337	825	535
1845	72,526	698	177	24,623	145	36
1846	41,862	330	125	13,833	48	23
1847	44,085	1,638	417	5,897	79	33
1848	12,308	504	229	12,749	229	15

During the years 1841 to 1846 the Tamil labourers must have saved or remitted to their country from £385,000 to £400,000 whilst the value of rice imported in Ceylon during the same period, chiefly from the Malabar and Coromandel coasts, was valued at £2,116,189.

But against this pecuniary advantage, a great loss of life is to be placed, for during the eight years above enumerated, not less than 70,000 Malabar coolies are believed to

have died in Ceylon. The quantities of coffee exported from Ceylon from 1836 to 1851.

	Quantity. Cwt	Value. £

—(*Ceylon Almanac for 1853*)

In all the coffee-producing countries of the East, and in most of those in the West, the berry is grown on land more or less elevated, at an altitude rarely less than one thousand feet, the average being certainly two thousand feet above the sea-level. There is a little coffee produced in one district of Ceylon where the altitude does not exceed nine hundred feet, but this is a very rare exception to the general rule. Two localities in Bengal which promised to be favorable to this cultivation, are not more than two hundred feet above the level of the sea: the one at a distance of about two hundred miles to the north west of Calcutta, the other scarcely more than eighty miles from the capital in an easterly direction. It is however stated by Niebuhr to have been brought from Abyssinia to Yemen by the Arabs from a country similar to their own plains and mountains. By that people it had for ages been cultivated in the hilly-range of Jabal, in a healthy temperate climate, watered by frequent rains and abounding in wells and water-tanks. In Arabia the plants are grown in grounds that are continually irrigated, and in soil from one to one and a half foot deep. Among the plantations are interspersed various kinds of trees, whose shade has a beneficial effect upon the coffee bushes. When in flower they diffuse a most delicious fragrance, in the midst of which the natives fix their habitations. The fruit begins to ripen in February, and when the seeds are prepared, they are conveyed to the city of Beitel Fakih, whence part goes to Mocha, and another portion to Hodaida and Loheira, whence it finds its way to Djedda and Suez for the Turkish and European markets—(*Engl Cyc* page 50). In Lower Bengal the cultivation of the coffee

plant made some progress, contrary to the expectations of many who were entitled to speak on the subject

*Mysoie*, has for a long period furnished an article which has gradually grown into public favor in England at a medium value. The coffee of Travancore sells in the London market at about the rate of ordinary Ceylon plantation kinds, but the produce of the slopes of the Neilgherries bids fair to rival some of the better qualities of that coffee. It is now about twelve years since the slopes of the Neilgherries first attracted attention as suitable for the growth of coffee. The altitude, the soil and the climate were highly reported upon by such of the Ceylon planters as visited the early clearings about 1854.

The following, showing the Coffee Plantations in 1862, in certain districts of the Madras Presidency prepared from returns furnished to the Board of Revenue by the Collectors of those Districts. The Board state that the information on which the Return is based, is partial, imperfect, and been obtained with much difficulty and that it can be considered only an approximation to the true state of things.

1860-61	165,816	185,71,414	32,41,699

The following exports were to the United  
Kingdom

Year	lbs	Value, Rs
1866-67	85,60,695	19,89,182
1867-68	164,94,647	41,86,815
1868-69	276,01,510	65,53,652

The following was exported to Foreign Ports,  
in other Presidencies

1866-67	161,10,050	37,87,743
1867-68	355,13,478	80,31,826
1868-69	473,31,372	107,49,353

The above will show how great had been  
the increase of coffee-planting in Madras.  
Indeed, about the year 1862, it was at its  
highest. Coffee lands, two years old, were  
then selling at £12 to 14 the acre. Of  
three year's growth, £15 to 17 of four

years, £18 to £20, and in full bearing  
£20 to 25, when coffee was worth 75 to 95  
shillings the cwt. From that year commenced  
doubts in the minds of planters, and ultimately,  
in some districts, the result was disastrous.  
Exceptional estates were paying dividends of  
twenty to sixty per cent, but from those  
yielding three cwt per acre, and they were  
the great bulk, there were no returns. In  
Coorg the altitude seems to have been over-  
great, and the enemies of the coffee-tree, the  
bug, the rot, the bore, insufficient capital, and  
the want of the owner's eye, were numerous.  
In Mysore, in the autumn of 1862, the various  
yields were

	Per acre cwts.
Coorg	7½
Astragram and Nuggur New Plantations	6½
Mungerabad old plantations	4½
Native plantations	1½

But the Coorg returns of 7½ cwts. were not  
deemed reliable. Under that date, there were  
said to be 45,000 acres of coffee in Astragram,  
30,000 in the Nuggur Division, and 5,000 acres  
in Coorg. About three cwt the acre was the  
average in Coorg, and there was cheap labour,  
cheap food and good roads. Yet in the au-  
tumn of 1866, the estates were unsaleable.  
As in every branch of industry, a special  
knowledge was needed for the selection of  
good and suitable land, skill was required in  
the formation of good nurseries, and in pruning,  
manuring and curing, and the economy always  
so essential to success.

A beautiful species of *Strobilanthes*, which  
grows in Coorg, is called the coffee plant,  
because thought to indicate soil suited for  
coffee trees. Coffee delights in a moderately  
warm and moist atmosphere, and in 1866, all  
the Coorg coffee tree became sickly. Coorg is  
deluged with rains during six months of the  
year, and scorched by the sun for the other  
half—(*Bride*).

Coffee has been grown in Mysore almost  
from the same time that the Arabs have  
known it. It was brought there from Arabia  
by a mahomedan pilgrim named Baba Bo-  
oden, who formed a college on a spur of the  
hills now called after him, and from there  
the coffee plants spread. From the year  
1832, Europeans entered into the agriculture,  
and Cannon's Mysore coffee, soon attracted  
the attention of dealers, for it rose from  
1846-7, to an average of 96 shillings the cwt,  
and had fetched so high as 115 shillings, and  
the selling price of native grown coffee in  
Mysore rose from one rupee per maund of  
lbs 28 to rupees six and eight per maund.  
The first European plantations, by Mr Can-  
non, were at Chikmoogloor near the Baba

Booden Hills the next were at the Munzera-bad ghat, and for many years the Mysore coffee districts were confined to the region of the Western Ghats and the Bababooden Hills. Some attempts have been made to cultivate coffee in the open country, but without success, it seems to require forest land and considerable elevation and moisture 'Cannon's Mysore' is grown on a range of hills from 3,500 to 4,000 feet above the sea, having the benefit of the south-west monsoon, which very seldom fails at all, never entirely, and it has, also, the tail-end of the north-east monsoon. It is probably to these advantages that the peculiar qualities of 'Cannon's Mysore' are attributed, viz, closeness of texture and richness of flavour. This elevation gives a pleasant climate well suited to Europeans. During the south-west monsoon the planter may be in his gardens all day long, without oppression in the hottest weather, the thermometer in the house on these plantations rises no higher than 81° or 82° Fahrenheit. The whole of the coffee district, with here and there an exception of feverish spots, possesses a climate in which the European can live and work with comfort, and, with moderate care and prudence, with health. Planting has of late years been carried to such an extent by Europeans and natives in Mysore, that but little available land remains. The mountain and forest wastes have been turned into rich productive gardens. From being the most wild and desolate parts of Mysore, these districts have become very prosperous, and the people have been raised from poverty to comfort, and in many instances to wealth. The natives are benefiting largely by the capital and example of European planters, and are learning the science of planting.

*Delhan* —In gardens in the Deccan, the coffee plant seldom exceeds nine or ten feet in height, plants are easily raised from fresh seed in a nursery bed where they may remain until they are one or two feet high, when they should be carefully removed to the situation where they are to remain for good, and placed at about twelve feet apart, they will thrive well in almost any good light soil, but require a certain amount of protection from the sun. The most favourable situation for a plantation is the side of a hill exposed to the east. As the plants suffer much from hot winds, the shade of plantain trees offers a good protection to them. In the neighbourhood of Aurungabad, were some coffee trees which bore fruit in abundance in a garden enclosed on all sides, and which even in dry weather was moist from being shaded by a number of high cocoanut and soopari trees, and the whole further

protected by surrounding buildings, from the dry winds during the greater part of the year. —*Riddell*

*Tenasserim* —Coffee not inferior to the best from Mocha, has been raised at Tavoy, but the plants do not flourish after the fourth or fifth year —*Mason*

On the hilly districts on the east coast of the Gulf of Siam, the cultivation is carried on on a limited scale. The annual produce is not much more than about 400 cwt, although it was understood to be increasing. The quality of the berry is reckoned to be nearly equal to Mocha, and it commands a high price in the English market.

*Soil* —The soil recommended in India is a good rich garden land, the situation high and not liable to inundation, and well sheltered to the north-west, or in such other direction as the prevailing storms are found to come from. Earth pulverised and cleared from the roots of rank weeds, but particularly from the coarse woody grasses with which all parts of India abound. A plantation, or hill affording shade to the shrub has been found beneficial in all tropical climates, because, if grown fully exposed to the sun, the berries have been found to be ripened prematurely. The seed reserved for sowing must be put into the ground quite fresh, as it soon loses its power of germination. Clean well-formed berries, free from injury by insects, or the decay of the pulp, should be selected. These berries must be sown in a nursery, either in small well-manured beds, or in pots in a sheltered spot, not too close, as it is well to leave them where sown until they acquire a good growth, indeed, it is better if they are removed at once from the bed where they are sown, to the plantation. If left too long in the nursery, they become unproductive and never recover. The distance at which they should be put out in the plantation need not exceed eight feet apart in the rows, between which, also, there should be eight feet distance. The seedlings appear in about a month after the seed is sown. A good manure is found in the decayed leaves that fall from the trees themselves, to which may be added the weeds produced in the plantation, dried and burnt. These, dug in, are always useful as manure, and should be utilized. Cow-dung is the best manure for the seed-beds.

The coffee seedlings from the nursery may be planted out in seven months, and they will yield a first crop in three or four years. A bushel will rear 10,000 plants covering ten acres. Coffee trees should be planted in rows six or eight feet apart in holes 20 inches deep by 18. They should be regularly topped

and pruned, so as to admit the sun to ripen the fruit on every branch, and be kept four to six feet high. The trees are generally in full bearing in the third or fourth year.

After the berries are plucked and brought in baskets, to the warehouse, the pulp or fleshy part is removed. The berries are placed in heaps in a loft, above the pulper. They are then sent down a shoot, into which a stream of water is conducted, and are thus washed into the pulper. The pulper is a roller covered with a sheet of copper, made rough like a nutmeg grater. The berries follow it as it goes round, but there is only room for the seed to pass, so that the pulp is squeezed off and carried away by a stream thrown off by the water wheel, while the naked coffee drops on the other side. The seeds are still covered with glutinous matter, to remove which they are washed in a cistern, the inferior ones floating while the good ones sink. The coffee seeds are then laid out on the *barbecus*, (which are square platforms of brick, plastered with chunam, with sides a foot high,) where they dry in the sun for about three days and are afterwards stored in godowns.

In this culture, the first care is the selection of a locality. This is of such paramount importance that if a material error be committed in choosing the land, all future economy, care and exertion will be but thrown away. The great requirements are elevation, shelter from wind, a good soil, and proximity to a cart road.

The coffee plant will grow and reproduce itself on a level with the sea, and, at 2,000 feet above it, the trees, whilst young, will have the most luxuriant appearance, come soonest into bearing, and yield the greatest measurement quantity per acre, but the bean is light and of an inferior quality. At and a little below this height there are in Ceylon extensive tracts of the richest land, but they are subject to long and frequent droughts, the crops are in some seasons scarcely worth collecting, and plantations sown in such lands soon fall off. This has been demonstrated on the plains of Doomberea in Ceylon, where most of the estates have become comparatively worn out in eight or nine years.

The best Ceylon properties are situated on the mountains, where rain is frequent and the temperature moderate. The soil is not generally quite so rich as in the valleys, but the forest being heavy and the fallen timber decaying gradually, a small though constant return is made to the land, whereas the trees cut down on low gardens are carried to the towns for firewood and other purposes.

The aromatic properties (and consequently fine flavour) of the coffee plant are best deve-

loped in Ceylon between 3,000 and 5,000 feet above the ocean. The higher it is cultivated with care, below frost, the better will be the quality of the produce. A mild climate and purified air are highly favourable to coffee, both of which are given by elevation. The cool climate to the Kandyan hills is equally invigorating to the planter and his shrubs, both luxuriating in a temperature of from 55° to 60° night and morning, whilst the thermometer rarely rises above 73° at noon. In the elevations above 4,000 feet the trees do not yield a maiden crop until three years after full bearing. The wood taking long to grow, is hard and firm before nature calls on it to support fruit, and it is reasonable to expect that it will remain longer in full vigour than a plant which is forced by the heat of lower situations into a rapid growth and speedy fructification, and which prevents the application of nourishment from the completion of its own body to the precocious reproduction of its species.

The appearance of "high mountain beans," is long, blue, the longitudinal seam curved, with its sides close and compact, its specific gravity is greater and its aromatic principle more abundant and finer than that produced on low lands, which is attributed to its being grown slowly in a cold climate. Though the quality on the hills is superior, the quantity is less. Seven cwt. per acre is calculated upon, whilst ten cwt. is the average from low lands, though it is said that one of the Unnesgunna estates once returned 18 cwt. per acre.

The difference of cost when laid down in Kandy between 50s and 80s (London prices), on coffee, does not exceed the ratio of 2 to 3, and in most instances the proportion is lower, on the latter, the weight of the produce of one acre being less, the cost of land, carriage, freight, Colombo and London carriage, &c &c, are proportionably lower and the profit higher. But coffee is one of those articles of which, though the inferior qualities may be unsaleable in Europe, a superior sample will always meet with purchasers about its real value, as it is consumed by a class who will have it, and who consequently must pay for it as a luxury. This was clearly shown in 1847 and 1848, when, although "Ceylon plantation" was sold from 35s to 50s. per cwt as a general price, a few samples from the highest estates brought 85s and 92s.

In selecting land it is better to choose an easterly or northerly aspect, for though the morning sun falling on the dew is said to injure the plant, and the setting sun to improve its fruit, the advantage of shelter outweighs these considerations. Where land lying to the S.W. has to be opened, the manager will

do well to take advantage of the natural facilities offered by the undulations of the surface and from fields, so as to avail himself of the protection afforded by rising ground with a belt of forest trees on its summit to windward, and such fields should vary from 7 to 10 acres in extent.

The southwest monsoon not only blows with great fury in the hill region of Ceylon, but appears to exercise a blighting influence, and to curl up and wither the few leaves it does not beat off the trees. After a strong gale, a field of coffee exposed either to its direct influence or any eddy wind, which is if possible more baneful, will be found in a great measure denuded of its leaves, the berries beaten off and the bark of the trees seriously injured round the part of the trunk where it strikes through the earth. When this is the case the best plan is to drive three stakes in the ground round the tree, and tie it lightly in such a manner that the friction and consequent exsiccation may at least be avoided, cut the plant down to two feet, and propagate the plantain tree for shelter. Under this management the shrubs spreading laterally will soon interlace their branches, render mutual support to each other, cover the ground, and so acquire strength enough to resist the force of the wind in a great measure, and then the plantains may be eradicated, and the land if tenacious will have been improved by their growth.

The best soil is of a deep chocolate colour, friable and abounding with blocks and small pieces of stone, which in the rainy season prevent the excessive washing away of the mould, and by their obstructing evaporation in the dry weather, afford refreshing coolness and moisture to the roots of the plants, such patches of land are generally found at the bottom of the escarpments of the hills, or in elevated valleys and rarely on the slopes. Quartzose land, of which there is much, must be carefully avoided and clay is equally bad. Quartzose land, which looked more like sugarcandy than anything else, has been planted and trees grew tolerable for a year or two, but they could never screw themselves up to the fructiferous point. There is a black earth too, which has deceived some people, it has the appearance of fine rich garden mould, but is in fact disintegrated quartz and mica, not having any of the good felspathic components in it. It is of no use planting in a good surface soil, unless it have at least two feet of depth, as the coffee tree has a long tap root.

The first work is to prepare a nursery, which must be proportioned to the extent of land to be cultivated, and situated with regard to proximity to the extended fields. The forest

having been cut down, the branches and logs are rolled on one side and the earth dug up a foot deep, all the roots and stones being carefully removed, it is then laid out in beds, six feet wide, with trenches between, which serve the double duty of drains and paths. Good seed having been procured, the grains are sown six inches asunder, if the land become parched, it will be well to shade it with green branches and irrigate it night and morning, should a long continuance of rain follow the sowing, the seed sometimes decays in the ground. It requires from six weeks to three months, according to moisture and warmth, before it germinates, and in four months more the seedlings are ready to be transplanted.

On opening an estate, the manager must look for his best soil and fell the forest in patches of not more than 30 acres in area. Some plantations have fields of two or three hundred acres, and in one instance in Ceylon there are one thousand acres in one clearing, but that is, to say the least, a very hazardous plan, for on such properties it is not a rare occurrence to see several acres together blasted by the wind and either permitted to run to jungle again, or dragging on a blighted, sickly existence, at an enormous and profitless outlay of capital.

When the forest is felled, the small branches must be lopped off and the larger ones thrown on them, which expedites the drying of the wood. Should there be no rain, the timber may be set fire to in a month. After a good running fire, very little has to be piled in heaps and consumed, as making neat work is a useless expense, baking the land destroys a great portion of its most valuable vegetable component parts, and the timber when left to decay forms excellent manure. The smaller branches which are not consumed should be cut up and laid as much out of the way of the plants and movements of the labourers as possible, but not burned. A Ceylon coffee garden bears no resemblance to a European garden. The land is generally a steep hill-side with undulating surface, huge rocks protruding their crowns, and enormous blocks of stone studding the whole extent. Blackened trunks of trees with their branches sprawling in all directions give the field the appearance of having once been the site of a town which is now laid in ashes, a confused heap of calcined stones and charred rafters.

It is estimated that an acre of jungle on the Neilgherries may be brought into bearing for Rs 200 including all expenses. A good dwelling house will cost Rs 4,000, the pulping house machinery and godowns Rs 4,000 more. The entire cost of bringing 100 acres into bearing was generally reckoned at Rs. 30,000.

The coffee-plant begins to produce fruit when two or three and a half years old, but the quality of the seeds from young stems is not so good as that from stems four or five years old. The size and colour of the bean (as the inner part of the seed is called) vary considerably, those from the West Indies being larger than those from the East.

From flowering to harvest is from eight to nine months. A field in full bloom is a beautiful sight, the clusters of white blossom contrast prettily with the deep green leaves, and the whole at a distance looks as if it has been snowed on. The flower only lasts one day. If the atmosphere be dry the bloom is sometimes lost, as it will not set without moisture, mists and light drizzling rains are the most favourable weather at this time.

The fruit grows on a foot stalk of half an inch, in clusters round the joints of the lateral branches, and when of full size, but still green, resembles small olives. A month before ripening it turns yellow and through different shades to ruby red, when it is ripe, and from its likeness to a European fruit is technically called "cherry." During the latter part of its growth, particularly, it requires a great deal of moisture, otherwise the bean will be shrivelled, not perfectly formed, light and of inferior quality. The climate of the hills is most beneficial when the fruit is filling and just before it ripens.

The "pulp" contains two seeds. They are covered by a viscous substance called "gum," and integument known as the "parchment," from its resemblance when dried to that animal product, and a pellicle named the "silver," which is very like gold beater's skin, and the grains of coffee, which are styled "beans." Sometimes there is only one bean in a cherry which takes a more rounded form and is called "peaberry." This is caused by only one of two embryos coming to maturity, whilst the other is abortive, the rudimentary form of which is always apparent.

When the fruit becomes blood red it is perfectly ripe and should be gathered.

The coffee tree if allowed, attains 15 feet in height, but in Ceylon, plantations are all kept down to 3 or 3½ feet above the ground. This makes the shrub shoot out laterally and produce at least 25 per cent more than it would do if permitted to attain its natural height and to occupy more land. In topping, care must be taken to cut off the uppermost pair of branches as their weight when in fruit would split the head of the stem. Nature is constantly throwing out young shoots, which try to grow upwards, but they must be carefully broken off as they are a great and useless drain on the juice of the plant. Never

cut a sucker or branch off a tree, but always break it.

In the course of a few days the cherry passes from yellow to blood red and a great number of coolies must then be employed—for, once ripe the sooner it is plucked the better. On very high plantations, though the heaviest gatherings are in June and December, some fruit is arriving at maturity almost all the year round, blossom, green and red berries, may frequently be seen on the same tree. This gives more trouble to the superintendent, but is better for the proprietor, who is not obliged to engage a large force of labourers when every one else wants them and when the labourer knows his own value. Where the crop extends over eight months of the year, the facilities for curing it are much greater and the cost of transport lighter.

When the quantity of coffee is small it is usually dried as plucked from the tree and the flavour is found superior to that which has been divested of its pulpy covering. But when the plantation is in full bearing, the extent of drying ground required, the length of time and the labour of moving so vast a weight, preclude the practicability of this plan. A pulping house must then be built. It should have a loft to receive the cherry and from which the machines are fed, a pulping room below where the mills are stationed, with a tank underneath. This building is all open, walls not being required.

The "pulper" is an oblong frame on four legs, furnished with a cylinder covered with copper which has been perforated by a triangular punch, from the side laid on the wood, leaving three-pointed apertures on the outside, like a nutmeg grater. In front of the grater is an iron bar or "chop," at a distance regulated according to the size of the bean, and a lower chop so nearly touching the copper that a sheet of letter paper may just pass through. A rotatory motion being given to the cylinder, the hopper above it being supplied with berries and a constant stream of water kept up, the teeth of the copper draw the berries against the chop and there not being space enough for them to pass between it and the cylinder, the pulp is torn off, carried between the lower chop and the barrel and passed away behind, whilst the beans are thrown out in front on a sieve, under the machine. The pulped coffee falls into a cistern below, and the "passed cherries," with a few stray husks, are returned to the copper.

The coffee is next thrown up together and allowed to remain heaped, until the gum is sufficiently fermented to be washed off, which is known by its feeling rough in the hand; this will take from 12 to 36 hours according

to the quantity heaped together and the temperature of the air, great care must be taken not to overheat it. Coolies must then dance amongst it for half an hour, and a stream of clean water being let in and the coffee agitated by rakes or machinery, all the gum and dirt will soon be carried away. The beans which rise to the surface of the water, being inferior and imperfect, must be floated off into another reservoir and separated. The store or warehouse may be constructed of any shape and materials, which circumstances or fancy dictates. It may be built of brick or timber and covered with tiles, felt or corrugated iron, but the most economical stores have the walls of jungle sticks and clay, are thatched with lemon-grass and have a loft or second floor in the slope of the roof, they are erected at a slight expense and answer every purpose. On some estates the pulping mills are turned by a water-wheel, which is a great saving of labour at the time when it is most in demand, but on the high hills, the cost of transporting heavy iron work is so great, the wages of good artificers so high, and the difficulty and delay in repairing any accidental damage so retarding to the other operations, that hand work is likely always to predominate.

Drying platforms, like the barbacue of the West Indies, are constructed of broken stones pounded together and glazed with a composition of mortar, fine sand, palm sugar (that from the palmyra being preferred) and bark juice, but as the cost is heavy, many planters prefer giving the ground a slope of 1 in 20, claying it and spreading matting to receive the coffee. Perhaps the best contrivance is a set of trays on wheels, fitting into a shed, one under the other, and which can be run in and out, on a tramway as the weather suits.

If coffee get two days' sun after washing, there is not much fear of its being injured by being kept long in store, indeed at this stage it is advisable not to expose it to the direct influence of the sun for nine or ten days, as the gradual drying causes the silver to separate itself from the bean and to hang on it like a bag. Coffee slowly dried will be easily divested of all the silver, and a clean sample insured, but, however ripe the cherry may have been when gathered, if the bean be hardened quickly, a portion of the pellicle will adhere, leaving a dirty sample and the impression on the buyer that it had been plucked half ripe. It is also thought that the quality of the article is improved by slow drying, or more properly speaking, that less of the aromatic principle is evolved. During rain, which is generally very abundant at fruit time, the wet coffee must be spread under cover, and constantly turned to prevent its heating, and

even that which is partially dried should be worked over twice a day, as a very little moisture in a large heap soon causes germination to commence and gives to one end of the bean that peculiar red tinge, known as "foxy" in the London market.

Produce must be hard dried, until the grains resist the nail and are quite horny, before it is despatched to the coast, but in the parchment, the protection against moisture which this shell affords, more than counterbalances the cost of its transport. After its arrival in the seaport, no time should be lost in cleaning and shipping it, having been sunned, it is put in a circular trough and a heavy wooden wheel passed over it, until all the husks are broken, it is then fanned and agitated in a perforated cylinder, through which the small beans and broken pieces fall.

It must be packed in well-seasoned casks and shipped immediately, for if exposed to the saline damp, with which the atmosphere of a tropical shipping port is generally charged, it will soon attract so great a quantity of moisture as to turn flexible and black,—there are few simple vegetable products, dyes excepted, which owe so much to their colour as coffee does.

The first adventurers naturally selected their lands near a government road, and, in Ceylon, hill estates were not so much as dreamt of, until all the available low lands were bought up.

Ceylon is peculiarly adapted to the growth of coffee, being a mountainous island, with three sides open to a vast expanse of ocean, drought is little known, even in the driest seasons the hills attract clouds, which frequently pour down refreshing showers. The heavy mists and dense clouds which sometimes shut out the sun for days together, or rolling sluggishly along the mountain sides, are amongst the planter's best auxiliaries. The shrub luxuriates in a rarefied, temperate and moist climate, and delights in frequent but not heavy rains on the slopes, where there is a good natural drainage—for any lodgement of water about its roots soon proves fatal. In one instance the enterprising but unfortunate proprietors believing it necessary to till the ground, went to work at a great expense, removed all the roots and ploughed up the land, but the result was a signal failure. Others left the largest forest trees standing for shade, but that has also been found injurious.

*Manure*—One great error into which Ceylon speculators fell, was to expect that the land was so rich as to be able to keep the plants up to one uniform point of fruitfulness for fifteen or twenty years without manure. The richest mould cannot yield crop after crop

for years, unless a proportionate return be made to it. Many tried decayed coffee pulp as a renovator, under the impression that by so doing they were placing in the ground what they wished to draw from it, but practice has too fully exploded the theory to leave any necessity for explaining its failing on scientific principles. At the same time it is equally certain that the coffee pulp in combination with other vegetable, animal and mineral matter, may form a valuable renovator of the soil. The skill of the chemist may be very advantageously brought to bear on this subject: he finds that the plant and its fruits are differently composed, he knows that it is more necessary to provide for the fruit than the stem which supports it, he finds that a large proportion of the bean is nitrogen, which his science teaches him may be produced by certain phosphates &c under particular circumstances, the knowledge accumulated by his own and other men's researches point out at once where salts and gases may be found, and he works on a certainty. He can in a few days and at trifling cost produce what the uninitiated may spend a life-time and a fortune over without attaining.

The most soluble and the best portions of the soil are washed away by the rains, and this is a subject which equally deserves the attention of the planter with the manuring question.

*Peeling, pulping, and winnowing*—The coffee peeler, used for separating the bean from the parchment, was formerly a large wheel revolving in a trough, the disadvantage of which was the flattening more or less of the bean when not thoroughly dry. A machine was subsequently introduced, the invention of Mr. Nelson, C.E., of the Ceylon iron works, by which that evil was obviated: its principle being not weight, but simple friction, of sufficient force to break the parchment at first, and, when continued, to polish the bean free from the husk. A very simple winnowing machine for cleaning the coffee as it comes out of the peeler, is attached. From the winnowing machine it runs into the separating machine, which sorts it into sizes, and equalizes the samples, by which a vast amount of time and manual labour are saved. The same principle was intended to be applied by Mr. Nelson to pulping, to obviate the injury inflicted by the grater upon the fresh berry.

In spite of the greatest care, numbers of the beans in a sample, on close examination, will be found scratched or pricked, and when the closest attention is not paid, or the person superintending the process is devoid of mechanical skill, the injury is proportionate. The ordinary pulping mill in use, consists of a cylinder of wood or iron, covered with sheet

brass, or copper, and punctured similarly to a nutmeg grater. This cylinder, technically called the barrel, runs upon a spindle, which turns a brass pick on each side of a frame. Immediately in a line with the centre upon which it turns, and placed vertical to each other, are two pieces of wood, frequently shod with iron or copper, called 'the chops,' placed about half an inch apart, or sufficient to allow the passage of "parchment" coffee between them. The lower chop is placed so close to the barrel, yet without contact, that all coffee must be stopped by it and thrown outwards. The upper chop is adjusted to that distance only which will permit the cherry coffee to come into contact with the barrel, but will not allow the berries to pass on till they have been denuded of their red epidermis by a gentle squeeze against its rough surface. The finer greater portion of the pulps are separated by being carried past the lower chops upon the sharp points of the copper, and thrown out behind, and few are left with the parchment coffee. As from the different sizes of the berries, and their crowding for precedence as they descend from the hopper above to the gentle embrace of the barrel and upper chop, some pass unpulped, the coffee as it comes from the lower chop is made to fall upon a riddle, which separates the unpulped cherries. These are put back again, and passed through a pulper with the upper chop set closer. The secret of working appears to be the proper setting of the chops, and many have been the schemes proposed for reducing this to a certainty. Perhaps, after all, few plans are better than the old wedges, by tightening or loosening of which the chop is kept in the required position. After working it for some years, the machine was considerably improved by non-cog-wheels being substituted in the place of straps and drums to move the riddle, and the riddle itself was formed of two sieves, by which the chance of unpulped berries reaching the parchment is lessened. On some estates water-wheels have been put up to drive several pulpers at one time, which otherwise would require from two to four men each to work them, but from the costly buildings and appurtenances which such machinery renders necessary, they are rare. Although the operation of pulping is so simple, it is one which requires the machine to be set in such a way that the greatest quantity of work may be done, or, in other words, the smallest quantity of unpulped berries be allowed to pass through. On the other hand, the berries must not be subjected to injury from the barrel, for if the parchment skin is pricked through, the berry will appear when cured, with an unsightly brown mark

upon it. Several other coverings for barrels, as substitutes for punctured copper have been tried, among others, coir-cloth and wire-net, but the old material has not been superseded.

After pulping, the coffee in parchment is received into cisterns, in which it is, by washing, deprived of the mucilaginous matter that still adheres to it. Without this most necessary operation, the mucilage would ferment and expose the berry to injury from its highly corrosive qualities. As some portion of pulp finds its way with coffee to the cistern, which, if suffered to remain, would by its long retention of moisture, lengthen the subsequent drying process, various methods have been adopted to remove it. One mode is to pass the coffee a second time through a sieve worked by two men, another to pick it off the surfaces of the cistern, to which it naturally rises. In August 1846 premiums were awarded by the Ceylon Agricultural Society to Messrs. Clerihew and Josias Lambert for the improvements they had introduced into coffee-pulpers, which, by their exertions, had been brought to great perfection. This pulper is one of the most perfect in every respect that has yet been brought into use, the disadvantages belonging to the old machine having been entirely remedied. The sieve crank has a double eccentric action. The chops are regulated by set screws, and the sieve suspended in a novel and secure manner, the whole combining strength and efficacy, together with an elegance of form, which has likewise been appreciated. Mr W. Clerihew, of Ceylon, submitted to the Great Exhibition a model of his approved apparatus for drying coffee, which has been patented in the name of Robert R. Banks, Great George Street, Westminster, and he received the Isis gold medal for the same. The intention is to dry the vegetable and aqueous moisture of the berry. Before this is required, the coffee has previously undergone the process of pulping, or removal from the soft fleshy husk. When the coffee berry is picked from the tree it bears a close resemblance to a ripe cherry, both in size and appearance, and several processes have to be gone through before the article known in commerce as coffee is produced. In the first place, the pulpy exterior of the cherry has to be removed by the process of pulping, which separates the seed and its thin covering called the parchment, from the husk. When the pulping process is completed, we have the parchment coffee by itself in a cistern, and the next process consists in getting rid of the mucilage with which it is covered. Having become assured, both by experiment and by Liebig's reasoning, that the successive stages of decomposition were wholly ascribable

to the action of the stagnant air which occupies the interstices between the beans, and taking into account that a mass of coffee presented a medium pervious to air, it occurred to Mr. Clerihew that it was possible by means of fans working on the exhausting principle, so to withdraw air from an enclosed space as to establish a current of air through masses of coffee spread on perforated floors forming the top and bottom of that space. The plan he carried into execution in 1849, and a stream of air was thrown through the mass of coffee, each bean of it became surrounded by a constantly renewed atmosphere of fresh air.

Grieg's Pea-berry Machine consists of three long metal rollers, so placed beside each other, as to allow, in their revolution, the flat beans to fall between them while the Pea-berries pass along the surface of the rollers into a box. Those who prepare coffee for the European market, can by this machine meet the fancy for Pea-berry coffee without the tedious employment of hand labour (*Madras Times*, 19th January 1859).

*Manuring*—There are many difficulties to surmount in manuring estates, owing to the localities of coffee plantations, though there can be no doubt that the returns obtained from manured plantations richly repay by a high standard of bearing. Cattle manuring is the most generally available, the cattle being stall fed on guinea grass, planted where the elevation of the plantation will permit it, or on Mauritius grass, which is planted in the ravines amongst the coffee, thus at the same time yielding a profit, and keeping weeds out of places where they are apt to grow. Pigs are also kept, and the pulps of the coffee are added to the fertilizing mass, indeed, rotting wood, weeds, burned dolomite, and anything which will produce ammonia, should be taken care of on estates. Each laborer should take out a basketful as he goes to his work, which a few men are employed afterwards, with mamoties, or forks, in burying around the roots of the trees. The manuring of a whole estate at one time is seldom required, but every part of the plantation should be brought under its operation every second or third year. One estate, which was wholly manured without limit as to expense, has amply returned the outlay by a production of about 20 cwt to the acre, lime, cattle manure, and mould from the neighbouring forest were used in a compost, and the soil turned up every where round the plant to apply it" (*Coffee Planting in Ceylon*, p. 52).

*Spacing out*—When cleared, the ground is marked out by a line and pegs, in squares of

six feet every way, and at each peg a hole 48 inches cube is dug. These are filled up with surface soil, and when rain sets in the seedlings are transplanted from the nursery to them. This would give 1,210 trees per acre, but owing to the rocks, streams and paths, where plants cannot grow, the average is 1,000 per acre. There is difference of opinion as to the distance trees should be apart from each other from experiments and observation, six feet is the best,—if they are further off, they will not cover the ground, in which case both land is lost and weeds grow more easily,—if they be closer than six feet the plants are subject to breaking and injury, as their branches lock into each other and obstruct the workman's passage.

In Ceylon in the first instance, nothing is needed beyond felling and burning the forest trees, and planting the young coffee seedlings at regular intervals in spacious holes between the huge stumps left to rot in the ground. The first care requisite is to afford shade to the young plants, many consider that this shelter should be continued during the whole period of their culture, but this is somewhat doubtful, as it has been found that plants so protected are not such good bearers as those which are exposed. The best plants for providing shelter are tall, wide-branching trees or slubs without much underwood. The other culture requisite is only to keep the ground tolerably clean from weeds, for which one cooly on from five to ten biggahs is sufficient. He should also prune off decayed or dead branches. This treatment must be continued until the fourth year, when the trees will first begin bearing, and, after the gathering of each crop, the trees will require to be thinned out from the superabundant branches, then extremities stopped, and the tops reduced to prevent their growing above seven or eight, the stems, also, should be kept free from shoots or suckers for the height of at least one foot, as well as clear from weeds. Irrigation must be frequent during the first year that the plants are removed to the plantation, and may be afterwards advantageously continued at intervals during the dry and hot weather, as a very hot season is found unfavorable to the plant, drying up and destroying the top branches and the extremities of the side shoots whilst, on the other hand, a very long rain destroys the fruit by swelling it out and rotting it before it can be ripened. Hence it is necessary to attend to a good drainage of the plantation, that no water be anywhere allowed to lodge, as certain loss will ensue, not only of the crop of the current year, but most frequently of the trees also, as

their roots require to be rather dry than otherwise.

The coffee plant has many enemies in nature to contend with, and the following is a list by Mr Nietner, of some of them in Ceylon.

- 1 *Pseudococcus adonidum*, White or Mealy Bug

 (Coffee rat)

The "rat" does much mischief by gnawing off the young branches, apparently to get at the tender pith, it is called "Didda-wedda" by the Singalese, is as large as a weasel, and of a greyish-black colour. Monkeys, squirrels, and the rat commit great depredations in fruit time, they are partial to the sweet pulp which they digest, but evacuate the beans whole.

The *Gardener's Chronicle* received from Mr Thwaites a specimen of a minute fungus. A few trees were first noticed to be infected in May, but at the time of Mr Thwaites' communication (July 24), two or three acres were showing the fungus upon the leaves. These latter fall off before their proper time. Amongst more than 1 thousand species of fungi received from Ceylon this does not occur and it is not only quite new, but with difficulty referable to any recognised section of fungi. Indeed it seems just intermediate between the mould and Uredos, allied on the one hand to *Trichobasis*, and on the other to *Rhizotrichum*. Though the fungus is developed from the parenchyma of the leaf, there is not any covering to the little heaps such as is so obvious in Uredo and its immediate allies, while the mode of attachment reminds one of *Rhizotrichum*. We are obliged, therefore, to propose a new genus for its reception.

As the fungus is confined to the under surface of the leaves, and the mycelium is not superficial, it may be difficult to apply a remedy, but we should be inclined to try sulphur by means of one of the instruments which are used in the hop grounds in Kent, or syringing with one of the sulphureous solutions which have been recommended for the extirpation of the hop mildew.—*Rev M J Berkeley*—*Colombo Observer*

The *Coffee Bug*, *Lecanium coffeæ*, *Walker*, establishes itself on the young shoots and buds, which it covers with a noisome incrustation of scales, enclosing its larvæ, from the pernicious influence of which the fruit shrivels and drops off. It is a Coccus, and a number of brownish wart-like bodies may be seen studding the young roots and occasionally the margins on the outside of the leaves. Each of these warts is a transformed female

containing a large number of eggs (700), which are hatched within it. When the young ones come out of their nest, they may be observed running about on the plant, looking like wood-lice, but shortly after being hatched, the males seek the undersides of the leaves, while the females prefer the young shoots as their place of abode. The larvæ of the males undergo transformation into pupæ beneath their own skins, and their wings are horizontal, and their possession of wings may possibly explain the comparatively rare presence of the male on the bushes. The female retains her powers of locomotion until nearly of full size, and it is about this time that her impregnation takes place. The pest does not produce great injury until it has been two or three years on an estate, but at length the scales on the plants become numerous, the clusters of berries assume a black sooty look, and a great number of them fall off before they are mature. The young shoots have a disgusting look from the number of yellow pustular bodies forming on them, the leaves get shrivelled, and on many trees not a single berry forms. The coffee bug first appeared in 1843, on the Lupallu Galla estates, and it, or a closely allied species, has been observed on the *Citrus acida*, *Psidium pomiferum*, *Myrtus Zeylanica*, *Rosa indica*, *Careya arborea*, *Vitex negundo* and other plants, and most abundantly on the coffee bushes in moist places. It reappears though eradicated, and is easily conveyed on cloths from one place to another. Dr Gardner, whom Sir J E Tennent quotes, is of opinion that all remedies have failed, and that it must wear itself out as other blights do.—*Sir J Tennent's Ceylon, Vol II p 248*

The Sydney "*Morning Herald*" describes an experiment on the Aphis or coffee moth which shows that by a very simple application, coffee plants may be freed from these destructive insects. A number of the insects were placed on a leaf under a powerful microscope. A drop of a simple solution of soda in water was let fall among them. They instantly left their hold on the leaf and fell dead. Such a solution could be applied without injury to coffee plants. Sulphur has hitherto been the favorite treatment.

In the southern parts of the peninsula of India, the Boer is a name given to the larvæ of coleopterous beetles which injure coffee trees. There are two, the white and red bore, the chief of these is the *Xylotrichus quadripes* of Chevrolat. In Coorg coffee trees have also been injured by the rot, a disease resulting from improper

pruning The rot attacks and decays the centre of the stem In Coorg, when the tree is attacked by the borer, the leaves become yellow and drop The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle The eggs are deposited by the female near the root of the tree, and the pupa borers tunnel up the heart of the plant

In 1859-60, the exports from the hill districts of Madras were from

COILGUDDY, a pagoda 8 miles east of Madura

COIMBATORE, a collectorate of the Madras Presidency, in the south of the peninsula Its chief town of the same name is in L 11° 1' N and L 76° 58' E, and is 1482 feet above the sea, at the palace

The district occupies an area of eight thousand four hundred and seventeen square miles, over which some seven thousand villages and hamlets are spread, possessing a population of nearly a million and a quarter of human beings It has but little rain, the chief source of water supply appearing to be wells, but it nevertheless yields an annual revenue of upwards of twenty-two lakhs of rupees The produce is grains, mostly of the dry description, cotton, sugar, tobacco and hemp In addition to these, are the usual "Garden" condiments and vegetables The climate is warm and not infrequently oppressive Being completely land, or more properly, hill locked, the district is only open to such streams of cool air from the sea board as can find their way to the vast plains of which it is composed through the gaps in the mountain chains Fever prevails at certain seasons of the year, and cholera invariably makes its appearance after the rains The aspect of the country is arid and unpleasant in the extreme, the few patches of green which are here and there produced by dint of hard labour, being the only refreshing objects presented to the eye Its northern part, called Collegal, has numerous small jungle covered hills, and to the west of Collegal are the Neilgherry hills The Anamallay hills are in the S W border of Coimbatore, and are richly clothed with

valuable forests, with many elephants, and some of the lower hill ranges from the Neilgherries, between which is the valley and gap or Pass of Palghat leading to the western coast. The Guzzlehutty pass leads up the deep valley separating the Neilgherry hills from Collegal. The Anamallay, (literally elephant hills), is a mountain tract covered by valuable forest trees, which about the year 1860 were worked with an annual profit of about Rs 50,000, and there are many beautiful woods in it suited for turnery. The wild animals are the elephant, tiger, leopard, bear, hyena, wild dog, bison, sambur, spotted and barking and hog deer also the wild goat. They are occupied by a race of hill-men, the Kadci, open, independent, straightforward men, simple and obeying their mopens or chiefs implicitly. They are strong built, active, with woolly hair and something of the African features, and file their front teeth to a point. The women wear enormous circles of pith in the lobes of their ears, which they distend down to their shoulders. A black monkey is their greatest dandy.

The localities in Combaratore, which supply the beryl, are also supposed to have yielded the emerald, though Tavernier was not able to ascertain that any part of India, in his day was yielding emeralds. Tavernier (*Travels*, p 144) says "as for emeralds, it is a vulgar error to say they came originally from the East. And therefore when jewellers and goldsmiths do prefer a deep coloured emerald inclining to black, tell ye, it is an oriental emerald, they speak that which is not true. I confess, I could never discover in what part of our continent those stones are found. But sure I am, that the eastern part of the world never produced any of those stones neither on the continent, nor in the islands. True it is, that since the discovery of America, some of those stones have been often brought rough from Peru to the Philippine Islands, whence they have been transported into Europe, but this is not enough to make them oriental. Besides that, at this time they send them into Spain through the North Sea"—*Tavernier's Travels*, p 144. *Lt Col Hamilton in letters* See India, p 324, Korumbur, Narapat.

**COINS** The coins current in British India, are the silver rupee of 180 grains, and its portions in half, quarter and eighth, also the copper half anna and quarter anna. These alone are coined at the mints. In the Hyderabad state, there are several rupees, the Hali Sikka, and others, all of less weight than the rupee of British India, and many shapeless copper coins. In Oomraoti the bankers pass sealed bags of money. In the Hyderabad state the copper coins in use are shapeless

lumps, with some obscure marks on them. In reality these copper coins are the chief part of the currency, the value of the several silver coins being various, and each varying daily in the exchange of the bazar. The reckoning is by four, which is called a "Ganda."

4 Cowries (Gavvala,) 1 Ganda

14, 16, or 18 Ganda 1 Thoodi or Pisa copper

4 Thoodi or Dooddi 1 Ganda of coppers

16 or 17 Copper Ganda 1 Rupee

In Arabia and the Persian Gulf, the silver real and the copper fulus are current, but the Indian rupee and the Spanish dollar also pass current. In the currency of Persia, when Mr Fraser travelled, the coins chiefly used in circulation were the toman, ducat, rupee (or real), abbassee or shabee and falusiah. The exact value of these coins is disturbed by the state of exchange between India and Europe. The number of abbassee in a real differs in different provinces but are in general from five to six, and there are about as many falusiah in each abbassee, the abbassee is not current everywhere, it is of silver, the latter are lumps of copper, heavy and shapeless, with a few letters stamped upon one side.

The following statement will shew the weight, fineness and stg value of the coins formerly coined at the Calcutta mint reckoning the value of gold at £3 17-10½ per standard oz, and silver at 5s 2d

Coins	Grains pure	Grains alloy	Grains Gross Weight	Value
				£ s d
1d Moh Gour	187 651	17 059	204 710	1 13 2½ 2225
Sicca Rupee	175 923	15 993	191 916	0 2 0½ 625
Furuckabad rupee	165 215	15 019	180 234	0 1 11½ 825

These coins are not now current. In the Straits Settlements, the rupee is current, but there and throughout the Archipelago and the sea coast of China, the dollar is largely in use. The sole Chinese coin is of copper, and silver and gold are in China, sold by weight.—*Fraser's Journey into Khonasan*, p 74

**COIR** is the fibre from the rind of the cocoanut. Is a corruption either of the Maldivian term Kaubar, or from the Tamil kayei, a rope. The Maldivian Kaubar is the name given to the cords with which the inhabitants, according to Abul Fazl sewed together the planks of their ship. Mr Faulkner says its Hindustani name in Bombay is "Katha." It is largely used in

India, and the exports during the year 1850-51 to 1860-61 were as under

	lbs	Tons	Value £
1850-51	7,846,720	3,503	21,614
1851 52	5,538,512	2,472	14,699
1852 53	6,511,344	2,907	17,300
1853 54	9,437,456	4,213	25,641
1854-55	8,078,560	3,606	27,638
1855 56	5,358,864	2,393	20,909
1856 57	8,293,712	3,703	25,828
1857-58	9,603,104	4,287	33,181
1858 59	10,250,800	4,575	36,335
1859 60	10,808,980	4,825	41,201
1860 61	13,064,660	5,832	57,281

This fibrous material appears in the market with various degrees of fineness. Such variety of appearance depends on the age at which the cocoanut is cut and the husk separated, and the care bestowed in steeping and cleaning. The husk or rind of the nut is thick and full of fibres, which in their separated state are well known by the names of coir or khau. In order to remove this husk, an iron spike or sharp piece of hard wood is fixed in the ground. The nut is then forced upon the point, which passes through the fibres, and thereby separates the rind from the shell. In this manner, a man can clean 1000 nuts daily. For the best coir, the outer rind of the nuts is bruised and steeped in water for two or three days, when it is taken up and the fibres separated by the fingers and scraped gently with a blunt knife, and dried in the sun. If steeped in water too long, they get dark coloured. Mr Robinson, of the Madras Civil Service, in his report on the Laccadives, thus describes the method of making coir in those islands. As the husk, he says, gets hard and woody if the fruit be allowed to become quite ripe, the proper time for cutting it is about the tenth month. If cut before this, the coir is weak, if later, it becomes coarse and hard, and more difficult to twist, and requires to be longer in the soaking pit, and thus becomes darker in colour. When cut, the husk is severed from the nut and thrown into soaking pits. These, in some of the islands, are merely holes in the sand, just within the influence of the salt water. Here they lie buried for a year, and are kept down by heaps of stones thrown over them to protect them from the ripple. In others, the soaking pits are fresh-water tanks behind the crest of coral. In these, the water not being changed, becomes foul and dark coloured, which affects the colour of the coir. When thoroughly soaked the fibrous parts are easily separated from the

woody by beating. If taken out of the pits too early, it is difficult to free the coir from impurities. If left in too long, the fibre is weakened, as is said to be the case also with that soaked in fresh water. The coir from the islands of Kadamat, Kiltan, and Chetlat, in the Laccadives, is said to be of the best description. The manufacture into cordage of the coir is entirely in the hands of the women of the Laccadives. When soaked sufficiently long, it is taken out of the pit and beaten with a heavy mallet. Subsequently, it is said to be rubbed with the hands until all the interstitial cellular substance is separated from the fibrous portion. When quite clean it is arranged into a loose roving, preparatory to being twisted, which is done between the palms of the hands in a very ingenious way, so as to produce a yarn of two strands at once. No mechanical aid, even of the rudest description, has yet found its way into these islands. In these islands, coir is one of the chief commodities of barter for the necessaries of life, as rice, salt, tobacco, &c. The coir is made up for their petty traffic in short *lute* of a mixed length and weight, and at the end of the year these are collected and made up into lengths of 70 to 75 fathoms, as received by the Government. The difference in the quantity of coir manufactured from the coast nut and from an island nut is very considerable. We may mention that forty cocoanuts are said to yield 6 lb of coir in Ceylon. Mr Robinson says "Three large coast nuts will yield 1 lb of coir, measuring twenty two fathoms whereas ten small, fine island nuts go to about 1 lb of coir, but this will measure thirty five fathoms. 2 lb of such yarn, measuring from 70 to 75 fathoms, are made up into sootie, of which there are fourteen to a bundle, averaging about a maund of 28 lb. A Mangalore candy of 560 lb, will thus be the produce of 5600 nuts, and should contain about 20,000 fathoms of yarn. The actual price of coir received by the islanders, is about thirteen rupees per candy. The value of the coir produce of a tree is calculated to be from two to two and a half annas, and that of the produce of one hundred trees, from fourteen to fifteen rupees. The average value of the total raw produce of a tree bearing fruit, would then be seven annas to a half rupee, and that of a plot of one hundred trees, forty-five rupees. Different modes are practised in Ceylon. At Calpentyia and the Akkara-pattoo, the natives separate the coir by burying the husks along the border of the extensive salt-water lake, and when, after six months or more, they are dug out very clean, the fibres

easily separate from the cellular tissue of the husk. This mode of preparing the fibre prevents the offensive smell emanated by macerating the husk, so common along the road from Colombo to Matura."

China imports coir from Haman and the Archipelago. The great use to which coir is put is for cordage, both ropes and cables, for boats and ships, for which from its lightness it is well suited. It is largely used by upholsterers as a material for stuffing mattresses, couches, pillows, it is used as a substitute for oakum in caulking ships. The fibre is also made into brushes and brooms, is a substitute for bristles, is cleaned, curled and dyed to resemble horsehair, and made into matting, door mats, and netting for sheep folds, woven into stair carpets and floor matting, bonnets, hats — *Loud's Rep. of 1862, Royle Fib. Pl. Robinson's Report on the Laccadives Hon'ble Mr. Morrison (Ondatje)*

COIX, a genus of plants belonging to the order Pinnaceae. Several species are known in India, aquatica, barbata, gigantea heteroclita, lacrima pumili. The following are Burmese names for species

Grows in India

COIX LACRIMA	LINN	
Ka-le thee	Burm	Coix millet
Job's tears	Eng	

The Burmese species of Coix, Job's tears, has large esculent seeds which are parched, like Indian corn in America, and they are often for sale in the Tenasserim bazar. It is extensively cultivated in the South of China for weaving floor matting of various degrees of fineness, the coarser kinds of which are used also to construct sheds to screen workmen when building houses and even the walls of the huts tenanted by the poor, the best comes from Lientau, west of Canton. No grasses are cultivated in China for food for animals, but the country produces many species fitted for rearing flocks and herds. A great deal of Coix (Job's tears) is cultivated in the Khassia Hills about Mollong. It is of a dull greenish purple, and though planted in drills, and carefully hoed and weeded, is a very ragged crop. The shell of the cultivated sort is soft, and the kernel is sweet, whereas the wild Coix is so hard that it cannot be broken by the teeth. Each plant branches two or three times from the base, and from seven to nine plants grow in each square yard of soil, the produce is small, not above thirty

or forty fold — *Hooker's Himal. Jour., Vol. II. page 289, Mason. Williams' Middle Kingdom page 277*

COIX MILLET Coix lacrima

COJIA, also written Khojah, Cojah. See Khajali

COJLA-JAMUN-KA-PHAL DUK Calyptanthus caryophyllifolia

COLABA, an island in lat 18° 37' N, long 72° 51' E 7 miles from Kandarac Island. In the spacious harbour formed by the islands of Chauli, Colaba, Bombay, Salsette, and the continent, several smaller rocky islands are scattered, bearing different names. Of these are Bombay, Elephanta, and a little island close to the latter that Europeans call Butcher island, but known to the people as Depdeva, the island of the gods — See Butcher island

COLA MAYA TAY Anacardium occidentale.

COLAPORE, a small territory in the Concan, and the name of its chief town, is ruled by a feudatory rajah. The territory has an area of 3184 square miles, with a population of 546,156, and a revenue of £100,000. See Kolapoor

COLAPTES See Picidae

COLAR LAKE, a marine lagoon of great extent, in the Masulipatam district, lying between Ellore and the sea. It is called the Colar Lake, but is one of the marine lagoons known in India as backwaters, which stretch around the peninsula of India, one of these, north of Madras is called the Lumore Lake, and there are several south of Madras and on the Malabar coast. See Lake

COLBERTIA COROMANDELIANA D C syn of Dilemma pentagyna, Roxb

COLCHICUM, a genus of plants of the natural Melanthaceae, more than one species of which grow in Central Asia. The medicinal substance known as Aruntata, is the inspissated juice of a bulbous plant, supposed to be a species of Colchicum. It is sold at a high price, and is much sought after by the people of the Hazarajat, in Central Asia, being of high repute in diseases of the eye. It is sold in small pieces of a dark colour, but is indiscriminately applied and must often act injuriously. Dr Stewart changes this into "Haun-tutiya." Hongberger states this is from Agathotes Chiretta. Dr. Stewart gives "Ba-phola," and Baphor as the vernacular names of another species of the Salt Range, the seeds of which are he says called "is af-gol" which seems the ordinary Plantago — *Mason's Journey, Vol. II p 338. Dr Stewart Hongberger*

COLCHICUM AUTUMNALE LINN

Suranjān ARAB | Kuljikoṇ, GR, of ARABS  
Meadow Saffron ENG | Suranjān-talk HIND PLNS

This plant grows in temperate northern climates. The Colchicum of medicine is the cormus and seeds of Colchicum autumnale-Linn which is well described by Dioscorides. It was used by the Arabs, and is their *surjan*, they give *kuljikoṇ* as its Gicek name. The Hermodactyls of the later Greeks and Arabs, and the sweet and bitter *surjan* of the Arabs, were no doubt species of this genus. Dr Royle's specimens have been described by Dr Pereira. A tincture of hermodactyl is prepared by taking Hermodactyl (*surjan talk*) powdered five ounces, proof spirit two pints, and in use and dose is the same as that of the Colchicum tincture, for which on emergency this may be substituted — *O'Shaughnessy Royle, p 601*

COLDENIA PROCUMBENS LINN, Roxb

Tupunkhi HIND, | Hamsa padu TEL  
Sira Padi TAN | Hama padu „

A small plant growing in Southern India, used as a poultice fresh, also, when dried in powder with fenugreek seeds is used to promote suppuration in boils.

COLE, H T of the Bengal C S, one of the founders of the Bengal Asiatic Society and author of many the most valuable contributions to its Transactions, after Sir W Jones, one of the most eminent Orientalists of his time *Ob 1837*. COLE, Robert, of the Medical Department of the Madras Army, in which he rose to the rank of Inspector General. He was Secretary to the Madras Literary Society. He

wrote on the laterite formation, and laterite of the Red Hills, in the Madras Lit Trans, Vol IV, 100. On mounds of scoriaceous ashes near Bellary. *Ibid Vol VII, 130 — Obui 1868*

COLE, Captain Robert, a military officer of the Madras Army, eldest son of the above Dr Robert Cole, author of an elementary grammar of the Coorg language.

COLEBROOKE, H T, was the first to give a tolerable sketch of the character and contents of the Vedas, in 1805, and in 1823-1827 he expounded the principles of the different systems of hindu philosophy. He was author of several memoirs on plants, published in the Linnean Society's Transactions and in the Asiatic Researches.

COLEBROOKIA OPPOSITIFOLIA Pan-sia HIND

A large shrub of the Sewalik hills, wood used as fuel, also to make gunpowder charcoal, and the leaves as fodder for cattle, and are applied to wounds and bruises.

COLEHAN, a part of Singbhum occupied by the Ho as their proper country. The Colehan is divided into Puhli or districts, each under a manki or chief, and each village has its Mundah or headman — *Dalton, p 163*. See India, Kol, Singbhum.

COLEOPTERA, a name first applied by Aristotle ('Aum' &c), and now universally adopted, to designate one of the orders in which Insects are divided, the species of which are commonly known by the name of Beetles, the "Chargol" of the Hebrews. The *Coleoptera* have usually four wings, of which the two superior, termed elytra, are not suited to flight, but for a covering and protection to the two inferior. They are of a hard and horny or parchment like nature, and when closed their inner margins which are straight, touch and form a longitudinal suture, the inferior wings, when not in use, are folded transversely under the superior and are membranous. From this character of having the wings in a sheath, the term *Coleoptera* was applied, it being composed of the two Greek words *κολεός* a sheath, and *πτερά* wings. The superior wings, which form a sheath, are generally called elytra. In about two months in 1854, Mr Wallace collected 700 species of beetles in Singapore, a large portion of which were quite new, and among them 130 distinct kinds of elegant longicorns — (*Wallace*) But though very numerous in some parts of tropical Asia, in others, as in one part of Dr. Hooker's Travels, they are most rare, and (what is remarkable) the wood-borers (*Longicorns* and *Cuculo*) particularly so. A large

*Telephora* was very common — *Hoolet Him. Jour Vol II p 65* The prevailing character of Indian entomology is uniformity. We meet with numerous genera, both of tropical and temperate climes, associated together, the former more abundant, the latter less frequent than in the Himalayas. There is, however, a greater intermingling of forms, many of the species resembling those of Europe, may have been captured on the mountain ranges, at a considerable elevation, but in the heated valleys of the East, we find many European types and species, in numbers sufficient to excite our astonishment. It will appear, then, that many species taken in temperate and northern climes, are not confined to them, and the range they enjoy is very considerable, extending not only over the Old World, but also to the New. As we advance from the poles to the equator, vegetation is more luxuriant, in proportion as heat increases, and the quality of work assigned to the insect races is proportionately increased. It is not natural to imagine that the functions performed by them in a colder climate, would in a warmer one require increased exertion and capabilities? It does not follow, because we find new types of form in tropical countries and new genera of superior bulk and power, and more abundant in individuals, that therefore they necessarily replace the old ones, and are to perform the duties peculiar to both regions, both may live and thrive together, and abound in the same countries, and will eventually be found to do so. When the genera of temperate climes appear within the tropics, they may have the same functions assigned them there, as in colder latitudes, but when we find new types of form, and a more powerful organization, with the size of the insects greatly increased (as is the case in tropical regions), it almost naturally follows that they are intended solely for those regions, and for the increase of work they are there destined to perform? Uniformity of entomological character throughout the peninsula and the East, is probably in a great measure to be accounted for by the general uniformity of its temperature, vegetation, and soil, there may, indeed, be other causes, which particularly influence it, but these may be esteemed the most essential. The range which genera here enjoy, is very considerable in part of the Himalayas, at the extreme southern points of India, in the West, and even in its Eastern Isles, there is one prevailing character, evincing every where the prevalence of tropical genera. In Nepal and the southernmost extremity of Mysore, and in Ceylon, at Bombay, and at Madras, at Calcutta and

Singapore, in Japan and Java, with the rest of the Polynesian Isles, the majority of the same types abound, and a great majority of the same species also occur in most of the abovementioned regions. If we turn our eyes to Africa, we shall there find a considerable similarity in the entomology of this quarter of the globe with that of Asia. Among the Carabidæ occur *Anthia*, *Orthogonius*, *Trigonodaetyla*, and *Siagona*. Among the Lamellicornes, *Epinus* and *Popillia*, the conical *Buprestidæ* and the extraordinary *Panossidæ*, which last are chiefly found only in these regions, and to these may be added the genera *Melyris*, *Megalopus*, *Sagia*, and *Adorium*, *Dorylus*, among the Hymenoptera, and *Diopsis* among the Diptera as well as many more. Passing from genera to species, we shall find that precisely the same occur in both continents, among the most conspicuous, are *Copris nudas*, *Sabæus*, and *Pithecius*, *Cetonia cornuta*, and *Lytta gigas*. One example is *Atenehus sanctus*, which very closely resembles the celebrated Sacred Beetle of the Egyptians, the object of their worship, regarded by some as an emblem of fertility, but more probably that of eternity. The beautiful wing cases or elytræ of the *Buprestis*, order 1st Coleoptera, are of a brilliant metallic green colour, and are imported into Great Britain principally from Calcutta, as ornaments of khus-khus fans, baskets, &c, and on muslins to enrich the embroidery. The beetle's wings sent from Birmah and Akyab were called "Chenk Poorie" and "Thungon Poorie". The blistering beetles of India are several species of *Mylabris*. The market value in Britain is only 5s 8d the pound.

*Fire fly* is the name given to species of Elater and Lampyrus, of the order Coleoptera, and to the Fulgora of the tropics. *F. lateranaria* is of South America, *F. candellaria* of S. E. Asia. The latter resort to moist places. The Lampyrus Fire fly is the Mouche lumineuse of the French. The Romans styled the luminous insects by the common names noctiluca, and luciola.

*Scarabæus atlas* is a native of Java, is one of the Prionidæ.

*Therates* is a genus of Coleoptera, of the tribe Cicindelidæ, confined to South Eastern Asia.

*The Dytiscus griseus*, one of the aquatic Coleoptera, is found in Europe and in Bengal.

Chinese insects were described as far back as the times of Fabricius and of Donovan in 1798, with this exception there were very scanty notices of other Chinese insects (consult Dejean's catalogues of Coleoptera) until Mr Hope, in March 1812, published half a century of the Coleoptera of Canton and Chusan, collected by Dr Cantor. Part of Mr Bowring's Coleoptera and Homoptera of Hong Kong and neighbourhood were published in the Annals of Natural History, Vol IV, December 1844, by Mr Adam White. The rarer species of the carabideous genera, frequent marshy localities on the summits of mountains. Several fine species were there captured in tolerable abundance, a fine *Galerita*, several *Chilæna*, three species of *Helius*, *Panagæus*, several large *Pheosopha* (*Brachinidæ*), a *Chrysa*, *Dyschirius*, *Casnomia*, and *Aiga* or *Leptotrachelus*. The beetles belonging to Badister, the Amaræ and Harpalidæ are of small size. The largest carabideous form has much the appearance of *Omaseus*. It is thirteen lines long. Including the tiger beetles and their allies with carabideous beetles, Hong Kong cannot produce much under 760 species. The carabideous genera are the most abundant of all the insect tribes during winter in Hong Kong, some forms commencing to appear with autumn. In April they are very abundant and there are still found a few in May. They then, however, give place to the cicindelidæ, none of which are found here during winter. Of Cicindela, Mr Bowring mentions ten species, *Colluris longicollis* is found on the flowers of *Bauhinia Vahli* (?) W and A. *Tricondyla pulchripes* (White) on Litchie Trees, differing in habit from its congeners by being found on trees, not at their roots. It is apterous, like other species. A small species of *Lebia* and of *Brachinus* is found on flowers. *Scarites* has not hitherto been found in the Island, and *Calosoma* and *Carabus* proper are

*Ateuchus sacer* —The sacred beetle of the Egyptians, is found in Egypt and Western Asia.

*The Lampyrus* —A tribe of the Malacodermous Coleoptera, including the glow-worm and fire fly.

probably confined to Northern China. Water beetles are abundant in pools during the spring months, and comprise genera from the giant *Trochilus* to the more minute but still interesting forms. At the same season *Coprophagous* insects are abundant. *Onthophagi*, armed cap a pie, yielding in interest to few of the Indian species, and so numerous that fifty species on an estimate were no exaggeration. *Copris*, *Onitis*, *Hister* and *Aphodius*, as might be expected, and perhaps the largest known species of *Sisyphus* on record—the *S. Bowringi* (White), remarkable for the extraordinary spinal projections from its coxae. Similar spines occur in *S. senegalensis*. The *Brachelytreous* genera are far from abundant, and the forms small, one of the largest is a small *Emus*, 6 lines long. Of other families of insects, the mass are found at the commencement of summer and during the summer rains, between April and August. *Dischicus Cantori* is found in Hong-Kong as well as in Chusan. There are many interesting species belonging to the *Melolonthideous* or *Cetoniideous* genera, and those soft-bodied insects, amongst which *Lampyrus*, *Cebrio*, *Malachius*, &c are classed. An *Attractocerus* is of very rare occurrence. *Elateidæ* and *Buprestidæ* not very abundant. *Dorcus* on the mountain range above Victoria in June. *Passalus* genus abounds over India and the Archipelago. The *Mylabridæ* few in species, abound in numbers. The *Heteromericous* genera tolerably numerous, but principally found under stones on hills, not on the seashore as in the Mediterranean. *Cossyphus* has not been found. The *Helopidæ* which devour *Agaricus* under bark are scarce, for trees are restricted to a few ravines in Hong-Kong. Notwithstanding this there are numerous forms of the *Longicornia* and *Cureulionidæ*, found on bushes if trees are wanting. A true species of *Tetraglenes* (a *Manilla* genus) with the four eyes quite distinct. To one of the families which bring up the rear of the *Coleoptera*, belongs *Sagra purpurea*, found on *Euphorbia antiquorum* as *S. lugubris* in Ceylon, is found on the castor oil plant—*Donacia* have been found in Ceylon at Point de Galle, *Lamnanthemum Wightianum* which grows in tanks, is devoured by a *Carabideous* larva. There are in Hong-Kong many interesting species of *Galerina*, *Cnoceridæ*, *Clythridæ*, the pretty *Platycoeryne bifasciatus*, Tortoise Beetles, and some of our early favorites, the *Vaches a Dieu*, one of which is a very large sized species. Three new species of *Paussus* were found under stones, and in the nest of a small yellow ant, all these had reached the highest elevation to be found in this island, upwards

of seventeen hundred feet. The three species all creptate, and at least one of them has a discharge staining like that of a *Biachinus*. *Coccoideous* parasites are found on the Dragon fly and on the common *Fulgora candelaria*, an inhabitant, but not illuminator, of the Pampalmoos trees. Out of the six hundred species of Chinese *Coleoptera*, which have been collected, at least five hundred require careful search amongst flowers, or under stones or other localities. Hong Kong is chiefly Indian in its forms, but the capture of so many *Carabideous* genera leads to the supposition that northern China, where a true *Carabus* is found, must contain some interesting beetles approaching to the European forms. In vain do we look on the sea shore of China for the *Scaphitidæ* and *Pimeliæ* so abundant in the Mediterranean. The cold season is in no country very productive of insects, that of Hong Kong produces numerous species of the only ones likely to be found during that season of the year—the *Carabideous* forms, whilst the China Pine, Dog violet, Azalea and Honeysuckle are in blossom.—(*Captain Champion in Journ. B. As Soc August 1848, No CXCV*)

*Cicindelidæ*—The following genera belonging to this family are not uncommon in India, viz, *Therates*, *Tricondyla*, and *Colluris* the two former are characteristic of a southern range, while the latter is abundant throughout the eastern continent. Of Indian *Cicindelidæ*, more than sixty species have been observed, the most splendid of the race abound in Nepal. Among various species, however, peculiar to the Himalaya, only one approaches the form of our European *Germanica*.

In Ceylon the recorded species of *Cicindelidæ* inhabit the plains or the coast country of Ceylon, and several of them are also found on continental India. Many of the species of *Carabidæ* and of *Staphylinidæ* have much resemblance to the insects of these two families in north Europe. In the *Scydmæindæ*, *Ptiliadæ*, *Phalacindæ*, *Nitidulidæ*, *Colydiadæ*, and *Lathridiadæ*, the northern form is still more striking, and strongly contrasts with the tropical forms of the gigantic *Copridæ*, *Buprestidæ*, and *Cerambycidæ*, and with the *Elateidæ*, *Lampyridæ*, *Tenebrionidæ*, *Helopidæ*, *Meloidæ*, *Cureulionidæ*, *Prionidæ*, *Cerambycidæ*, *Lamnidæ*, *Eudomychidæ*. The *Copridæ*, *Dynastidæ*, *Melolonthidæ*, *Cetoniidæ*, and *Passalidæ* are well represented on the plains and on the coast, and the species are mostly of a tropical character. The *Hydrophilidæ* have a more northern aspect, as is generally the case with aquatic species. The order *Strepsiptera* is considered as belong-

ing to the Mordellidæ, and is represented by the genus *Myrmecolax*, which is peculiar, as yet, to Ceylon. In the Curculionidæ, the single species of *Apion* will recall to mind the great abundance of that genus in North Europe—(*Tennent's Sketches of the Nat Hist of Ceylon*, p 443 444)

COLLADDI or KOILADDY, a fort on the island of Seringham

COLLE Fr Glue

COLLERI, a race occupying the country south of Trichinopoly. Until late years so predatory that in the south of the Peninsula of

India, Colleri became the designation of a thief derived from Kallara thieves, plunderers. In ancient times they seem to have inhabited the woods from Trichinopoly to Cape Comorin. Orme writing of them, describes them in the middle of the 18th century as expert thieves and plunderers, and the Jesuit Father Martin, says they were very cruel. Pennant writing of them in the 18th century, says "the adjacent countries are covered with thick forests and little cultivated by reason of the savage inhabitants, the Polygars and Colliers, who may be truly styled 'sylvestres homines'". The Colliers, he adds, were predatory and their government, as also that of the polygars, feudal. The Colliers are in number thirty or forty thousand. Their country is hilly. They generally sided with mahomedans and the British in the wars against the French in the times of Clive and Duplex — *Pennant's Hindostan Orme's Hindustan*

COLLETTIA SPINOSA See Evergreens

COLLENSIA GRANDIFLORA A bright flowering plant, exotic, cultivated in the gardens of Europeans — *Riddell Jaffrey*

COLLOCALIA, a genus of birds belonging to the family Cypselidæ. There are two species, one of which, C linchi, is the swiftlet that produces the edible bird's nests used in China as a restorative food. The other species is C nidifica. See Bird's Nests, Birds

COLLOCALIA BREVIROSTRIS A swallow supposed to be one of those producing the edible bird's nest. There are two species of Collocalia. See Aves Bird's Nest Birds

COLOCASIA RAY A genus of plants of the family Araceæ, of which several species grow in the south and east of Asia, viz, C antiquorum, cucullata, esculenta, formicata, odorata, indica, macrorrhiza of Ceylon, and C Himalensis of the Himalaya, several of them have edible roots, all of them remarkable for containing a milky juice. They are grown in S<sup>t</sup> Europe, the East and West Indies, and in Polynesia, where the leaves and roots, under the name of yam, Coco, Eddo, are used as food. The following species are known

C antiquorum	C formicata	C mucronata
C bi-color	C himalensis	C nymphæfolia
C arborescens	C indica	C odora
C cucullata	C macrorrhiza	C villosa

This species is cultivated in Brazil, the East and West Indies, Burmah, the Archipelago, and Polynesia. The root somewhat resembles a pine apple, but is globular. It

is rather coarse, but is used by the natives at Bombay, who make use of the tubers in curries, &c. This seems to be the plant so largely used in the West Indies and Polynesia under the names Coco, Eddo, and Taro. It is a valuable root, shaped somewhat like a yam, and when well boiled and afterwards roasted is not inferior to it in taste. It is the common food of the inhabitants of Travancore, where there is a superior variety of it, with broad, purple coloured leaves. The Warriah (qu Oorah?) in the Ganjam Circars call it Cutchoo, the Malays of the Eastern islands hold it in high estimation. Niebuhr says it is produced in abundance in marshy situations in Arabia as well as in Egypt. Rumphius says, "Nutrimentum est catholicum in orientalibus hinc insulis et tanquam utilissima regions censetur planta eodem modo, quo ab antiquis jam fuit temporibus in Egypto, licet ibi haberetur cibus rusticorum, ac forte persaracenos ejus usus innotuit. Occidentalibus Africæ et Europæ partibus, ita ut haud inepte Æthiopum panis vocari posset"—*Rumphius, tom v page 316 Ainslie Voigt Jaffrey's Hunts Niebuhr Travels Graham in Thompson's Records of General Science, Vol IV p 38*

COLOCASIA GRANDIFOLIA. The great leaved Caladium, is the "Alou" of Bombay.

COLOCASIA HIMALENSIS. See Colocasia.

### COLOCASIA INDICA ROXB, Voigt

Arum Indicum *Lou. Roxb W Ic*

Man Kuchu BENG | Tota calr akhisa TEL

This is cultivated in India, where its esculent stems and pendulous tubers are eaten by all classes of natives.—*Voigt Gen Med. Top, p 207*

COLOCASIA MACRORRHIZA. In the Fiji islands, is called Ndalo or Taro, there is a water and a land variety, the former of which is the more usually grown. The average weight of the roots is 2 lbs and the crops are raised from November to April. It requires irrigation. The young stalks and leaves are used like spinach or in soup. The root is employed for making the mindrai or native bread. It contains much starch.

κολυκμδης of the Greeks, and Colocynth, the *Hunzal* of the Arabs, has been used in medicine from the earliest times, and is one of the plants supposed to be the *Pakyoth* or *wild gourd* of Scripture.

The plant grows in many parts of India, on the sandy lands of the peninsula, Dekkan, Guzeiat, Kara, Delhi. The plant yielding it is the *Citrullus colocynthis*, the *cucumis colocynthis* of Linnæus. Dr. Burn states colocynth of two kinds occur in Guzeiat, the *Cucumis colocynthis*, and the *C. pseudocolocynthis* — The colocynth of commerce is the dried fruit, peeled and unpeeled, and is brought from the Levant, North of Africa and South of Spain. Colocynth is useful for protecting shawls and feathers against insects. The colocynth used in medicine as a hydropogogue cathartic is an extract from the fruit. That known in India by the Arabic names *Indrayun* and *Bislumba*, is obtained from the *Citrullus pseudocolocynthis* of Royle. *Him Bot* 47, fig 2, *Royle Mat Med* Sprey's *Suggestions McCulloch Dict*, p 326.

**COLOCYNTH OIL** An oil prepared in India from colocynth seeds

**COLOMBO**, the seat of Government in Ceylon, has a population of 40,000 people. It seems to have been selected by the Dutch from the proximity of the cinnamon gardens for it has no other recommendation. It was visited by the Portuguese in 1505. It capitulated on the 16th February 1796. It is on the west coast of the island, in Lat 6° 56' N, Long 79° 53' E, and exports largely to Europe. Colombo is mentioned in Singalese historical annals so early as A D 496, the name is said to signify a seaport. This and Covelong, south of Madras, and Quilon of the western coast, are all the same name "Kulam" — *Horsburgh Sur*

**COLOSSOCHELYS ATLAS**, a vast fossil land tortoise of the Sewalik Hills, in the north of India, discovered by Dr Falconer and Major (afterwards Sir Proby) Cautley. It is supposed to have become extinct since the creation of man. It is of enormous size. The Sewalik hills are in India a tertiary chain apparently formed by the detritus of the Himalayas. A great number of huge fragments, derived from all parts of the skeleton except the neck and tail, have been obtained. A diagram by Mr Schaif showed the animal restored to the natural size, of reptilian forms discovered in the fossil state, colossal representatives have been found in the Sewalik of all the known tribes, such as the *Iguanodon*, *Megalosaurus*, *Labyrinthodon*, &c, besides numerous forms of which no living analogues exist, such as the *Englisaurian* reptile, and *Pterodactyles*. No fossil *Testudinata* remarkable either for size or deviation from existing forms, have hitherto been found in the fossil state. The *Colossochelys* supplies the blank in the first respect, while it differs so little from the land-tortoises in the general construction of its osseous frame, as hardly to constitute more than a sub-genus of *Testudo*. The affinities with *Testudo* shown in the shell, and the extremities, were found to hold equally good in the construction of the head, of which a comparatively small sized specimen, inferred to have belonged to a young or half grown *Colossochelys*, was exhibited. The head of the adult, to correspond with the dimensions of the shell and according to the proportions furnished by a large *Testudo Indica*, was deduced to have been two feet long. The generic name given by the discoverers has reference to the colossal size of the fossil (κολοσσός et χέλυς), and the specific one to its fitting representation of the mythological tortoise that sustained the world according to the systems of Indian cosmogony.

The first fossil remains of this colossal tortoise were discovered in 1835 in the tertiary strata of the Sewalik Hills, or Sub-Himalaya skirting the southern foot of the great Himalayan chain. They were found associated with the remains of four extinct species of mastodon and elephant, species of rhinoceros, hippopotamus, horse, anoplotherium, camel, giraffe, sivatherium, and in a vast number of other mammalia, including four or five species of quadrupeds. The Sewalik fauna included also a great number of reptilian forms, such as crocodiles and land and fresh water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India, in particular to the *Crocodilus longirostris*, between the existing forms of which and heads dug out of the Sewalik Hills, no difference is detected. The same result applies to the existing *Emys tectum*, a common species in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. Prof. Thomas Bell considers that there are no characters shown by the fossil to justify its separation from the living *Emys tectum*. There are other cases which appear to yield similar results, but the evidence has not yet been sufficiently examined to justify at present a confident affirmation of the identity.

There are fair grounds for entertaining the belief as probable that the *Colossochelys Atlas* may have lived down to an early period of the human epoch and since become extinct—1st, from the fact that other Chelonian species and crocodiles, contemporaries of the *Colossochelys* in the Sewalik fauna, have survived, 2nd, from the indications of mythology in regard to a gigantic species of tortoise in India—*Jour As Soc Ben* No 247 of 1855.

**COLOURED HORSE SHOE BAT** One of the Chiroptera.

**COLOUR** *Colour Sticks* for lacquer ware are used in the Panjab, by the Kharati, or wood turner, to colour his ware when the turning process is complete. The stick consists of shell lac, melted down with a certain proportion of wax and sulphur, and coloured by various simple or compound colours. They are applied by the hand. The operator holds the colour stick against the turned wood object while revolving rapidly, the heat produced by the friction melts the lac and the colour is deposited on the surface of the wood. The skill and fancy of the operator directs him either

in laying on a uniform layer of colour, or else putting it on in little spots or touches, by allowing the colour stick only very lightly to touch the revolving wood, thus producing either a smooth uniform color, or the pretty mottled appearance so often observed in lacquered ware. Two or three different colour sticks are often applied, giving the whole a marbled appearance of great beauty. The colour thus applied is spread, fined and polished, by pressing the edge against the turned object while revolving. The final polish is given by a rag with a little oil. The principal colours are of lac, crimson, orpiment, red-lead, green, made of orpiment and Prussian blue, dark blue, indigo or Prussian, black white, brown or gold colour, light blue or ultramarine.

*Colours for enamels* Vitreous masses are employed by the "minakar," or enameller on silver, &c. The colours are principally green and blue, salts of iron and copper diffused through vitreous matter, a yellowish colour also is produced by litharge. The manufacture, which consists in taking a silver or metal vase, having the pattern of leaves or flowers worked on it in relief, and filling the hollows with enamel in a melted state. The colours exhibited are blue, green and red. The art of making this material is known in Lahore, Mooltan and other places.

*Colours from the mineral kingdom*, are procurable in Southern India from the following places—

Alumina coloured with madder lake (prepared from the munjeeth or <i>Rubia tinctoria</i> )	Chingleput
Antwerp red	Ganjam
Burnt sienna	Hills near Salem
Bright yellow ochre	Hills near Cuddapah
Brown ochre	Chingleput
Cologne brown	Neigherry Hills
Clean colored ochre	Hills near Salem
Dark shade of grey ochre	Nuttum Hills
Dark umbre	Neigherry Hills
Deep yellow ochre (common in the bazars of Madras)	Madras
Flesh coloured ochre	Near Salem
Indian red	Hills near Chingleput
Iron sand	Bimlipatam
Livender coloured ochre	Bangalore
Light red ochre (prepared from the yellow ochre)	Nuttum Hills
Orange ochre, (made from the yellow ochre by heat)	Near Cuddapah

Silvery white kaolin	Bimlipatam
Ultramarine (prepared from the lapis lazuli)	From Bombay
Venetian red	In the Bazars in Madras

Warm stone coloured ochre      Near Chingleput  
White ochre or porcelain earth      Bangalore

*Chinese red colour* is made from Taow-fau, or copperas, their mode of preparation is by putting a pound of copperas into a crucible, over which another crucible is luted, having a small hole in it, which is lightly covered over. around these they pile charcoal, and enclose the whole within bricks, when they fire the charcoal, and as soon as the fumes, issuing from the aperture in the crucible, become of a light colour, a small quantity of the copperas is taken therefrom, laid upon fir-wood, and moistened with water, if the colour then prove to be a bright red, they remove the fire, if not, they allow the copperas to remain subjected to the heat until it assumes that colour, and then remove the fire. When the crucibles are cool, a cake is found in the lower one, but the finest colour is encrusted on its sides and on the bottom of the upper crucible, which is kept separate from the cake, the pound of copperas produces about four ounces of colour.

*Chinese white colour* is made from calcined transparent flint, to an ounce of the powder of which they add an equal quantity of white lead.

*Chinese green* is beautiful. It is prepared with one part of powdered calcined flint, two parts of white lead, and six parts of the scales of well hammered copper.

*Chinese violet* is produced by adding an additional quantity of the prepared white to the green.

*Chinese yellow* is made by combining equal portions of prepared white and red.

All these various colours are used by the China-ware painters, having been previously dissolved in gum-water, to which they occasionally add saltpetre, copperas, or white lead. The colours are laid on after the first baking and varnishing of the China-ware, but the beauty and depth of the colouring is imperceptible until after the second taking.

*Black China ware*, the Ow-mi-ew, ornamented with gold, is very much prized in China to make it they mix three ounces of azure, and seven of the oil of stones, this is laid on the ware, and when perfectly dry, it is baked, after which the gold is laid on, and the vessel is rebaked.

*Cracked porcelain*, the Towi-kie, is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined transparent white pebbles, this has the property of marbling and veining the ware and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited, this China ware is highly prized under the cognomen of the cracked porcelain.

*Colours of Dress* It would appear from numerous observations that soldiers are struck during battle according to the colour of their dress in the following proportion red is the most fatal colour the least fatal, Austrian grey. The proportions are, red, 12, rifle green, 7, brown 6, Austrian blueish-grey, 5 — *Jameson's Journal*, 1853 *William's Middle Kingdom Powell's Handbook, Sui's Chinese, Madras Ex Jur Rep*

COLTS are taken in tribute by several Eastern races, and in the ancient Persian empire, the tribute of the distant Satrapies was of this kind. Aemema, according to Herodotus, alone gave an annual tribute of twenty thousand colts. Up to a recent date, the princes of Amber received as tribute all the colts reared on one of their estates. Many of the Persian horses which were brought to India up to the middle of this century, were supposed to be tribute horses — *Tod's Rajasthan, Vol II, p 390*

*COLUBER VITTA CAUDATUS* BLYTH, affined to *C. Fasciolatus*, Shaw. Vertical plate pentagonal, with obtuse posterior apex. A single fœnal. Nineteen rows of scales, abdominal scutæ, 220 caudal scutellæ, 95 pairs. Ground colour olive, paler below a broad black streak behind each eye, not continued on to the neck, and hardly showing anterior to the eye rest of the head and neck without markings. Tail short, with four longitudinal black bands of a whitish ground anterior to the vent, the upper band, on each side becomes much broader, and is crossed with numerous pale striæ, more or less distinct, which, at about the second posterior fifth of the entire length of the animal, coalesce and unite to form a lateral pale band, more or less broken and continued forward to the neck above and below this irregular pale band, are a series of black elongated diamond squares, pale centred excepting those towards the neck, the upper series of these squares uniting, each with its opposite, leave a series of lengthened oval pale spots along the middle of the neck, continued (from about the third fifth of the length of the animal) as an unbroken pale-band, to the end of the tail. Lower parts pale, mottled with black resolving into two dark lines upon a pale ground, along the posterior two-fifths of the entire length. Length of specimen, 19 in, of which tail  $3\frac{1}{2}$  in. From the vicinity of Dajiling — *Beng As Soc Jour No CCXLV. No VII of 1854* See Colubridæ

## COLUBRINA ASIATICA R BR

- Ceanothus Asiaticus* Linn Roxb  
" *capsularis* Forst  
Asiatic Red wood Eng

A large shrub with pale greenish flowers, belonging to the natural order Rhamnaceæ. Voigt notices other two shrubs of this genus, *C Nepalensis* of Nepal and *C macrophylla* of Martaban—*M R Brown Voigt*

COLUMBA, a genus of birds belonging to the family Columbidae, and order Gemitores. Jerdon names *C intermedia*, *C rufestris*, *C leucanota* as occurring in India, *C aromatica*, *C coronata*, and *C carpophaga* are now referred to other genera. The most common in India of the genus is the *Columba intermedia*, Blue pigeon

C livia var *Blyth*

- |               |      |            |     |
|---------------|------|------------|-----|
| Pagoda pigeon | ENG  | Kovilpora  | TAM |
| Kabutar       | HIND | Gudi-purai | TLL |
| Parivi        | MAHR |            |     |

They congregate in large numbers and breed wherever they can find suitable spots, on pagodas, mosques and tombs. The com-

mon blue pigeon differs from the *C livia* of Europe, only in having an ash coloured, instead of a pure white rump. The *C livia* of Europe or rock pigeon with its subspecies is the parent form of all domesticated pigeons. Of these, there are at least 150 varieties. There are four groups, consisting of the German, Dutch, and English pouters. A second group includes the Kah-pir, Munassa, Bussorah, Dragon and English carrier, the Bagadottien, Scanderoon, Pigeon Cygne Rients, the Troufa and the Bank.

The third group includes the Java and English fantail, the Turbit and African owl, the Persian Lotan, common and short faced tumblers, the Indian frill back and Jacobin.

The fourth group includes the Dove-cot pigeon, swallow, spot, nun, English frill back, Laughier and Trumpeter.

*Columba livia* 'Rock Dove' of Europe, North Asia to Japan, N Africa, abundantly replaced in India by the barely separable *C intermedia* Blyth Darwin.

COLUMBELLÆ A genus of Molluscs, See Mollusca.

COLUMBIDÆ, a family of birds belonging to the order Gemitores.

## ORDER IV—Gemitores or Pigeons

## Fam. Columbidae

Subfam. *Treroninae*, 5 gen. 3 sub-gen. 23 sp, viz 3 *Totia*, 8 *Treron*, 3 *Sphenocercus*, 4 *Ptilinopus*, *Carpophaga*.

Subfam. *Columbinae*, 7 gen. 21 sp, viz 2 *Alsecomus*, 3 *Palumbus*, 2 *Columba*, 4 *Macropygia*, 2 *Geopelia*, 7 *Turtur*, 1 *Chalcophaps*.

Subfam. *Gourinae*, 1 gen. 1 sp, viz 1 *Caloenas Nicobarica*.

Dr Jerdon thus arranges the Gemitores or pigeons, syn Columbæ, Latham.

Fam. *Treronidae*

Subfam. *Green pigeons* viz 2 *Totia*, 2 *Crocopus*, 4 *Sphenocercus*, 2 *Sphenocercus*.

Subfam. *Carpophaginae* Fruit Pigeons viz 2 *Carpophaga*.

Fam. *Columbidae*

Subfam. *Palumbinae* Wood Pigeons viz 2 *Alsecomus*, 3 *Palumbus*, 1 *Palumbus*, 3 *Columba*.

Subfam. *Macropyginae* Cuckoo doves viz 1 *Macropygia*.

Subfam. *Turturinae* Turtle doves viz 6 *Turtur*.

Subfam. *Gouridae* Ground doves

Subfam. *Phapinae* Ground doves viz 1 *Chalcophaps indicus*.

Pigeons, doves and turtles are abundant in Southern Asia and the Indian Archipelago.

*Columba aromatica* of Latham, now *Vinago aromatica*, is of a mild and timorous disposition, and is generally seen in flocks or societies except during the period of reproduction, when they pair, and retire to the recesses of the forest. The nest is simple, and composed

of a few twigs loosely put together, and the eggs are two

*Carpophaga oceanica*, Selby, is the *Columba oceanica* of Lesson, and according to Lesson is the Moulonessie, or Moulens, of the natives of Onalan. It approaches the nutmeg pigeon *Columba (Carpophaga) onea*, very nearly, but differs from it in size, being one-third less, and in the distribution of some of its colours.

"The Nutmeg Pigeon lives more particularly in the eastern Moluccas and especially at New Guinea and Waigion, while the Oceanic Fruit pigeon is abundant in the little isle of Onalan, in the midst of the great archipelago of the Carolines and seems to exist in the Pelew Islands, it may possibly spread over the Philippines, and it Mignamio."

*Geophilus melanurus* is the *Columba melanurus* of Latham, the *C. gillius* of Wagler. It inhabits the Nicobar islands, Java, Sumatra, and many of the Moluccas. Mr Bennett, who saw them in Mr Beale's aviary at Mexico, says that they were usually seen perched upon the trees, even upon the highest branches, and adds, that they build their inde nests and rear their young upon trees similar to all the pigeon tribe.

*Lophyrus coronatus* is the *Columba coronatus* of Latham, *Phasianus cristatus* Indicus of Brisson, *Columba Hocco*, Le Vaill, *Colombe Gamine Goura Temm*, Great Crowned Pigeon, Edw. A species surpassing in size all the other *Columbidae*. Total length from 27 to 28 inches. This bird is found in many of the islands of the great Indian group. Not rare in Java and Banda, abundant in New Guinea and in most of the Moluccas. Nest built in trees, eggs two, coming of the male hoarse, accompanied by a noise somewhat like that of a turkey-cock when strutting. Its food consists of berries, seed, grain, &c. Flavour of the flesh said to be excellent. *Eng Cyc* pages 70, 91 *Jerdon Birds of India Catalogue Birds Ben As Soc Cat Birds India House Museum* See *Columbidae Birds*.

COMALA. HIND. The lotus, pronounced *kawal*. AIRANKOWAL, the lotus of the desert, from *aranya* (Sanskrit), 'a waste,' and *comala*, lotus. By the spelling, it should be called *arancomala*, but the pronunciation is as above.

COMANCHES. See Hindu

COMANES, a city mentioned by Ptolemy, supposed to be Nagaria, near Cambay, now in ruins.

COMANI, a branch of the Catti tribe of Samashtra, whose *pallia*, or funeral monumental pillars, are seen in groups at every town and village. The Catti were one of the early German tribes—*Pod's Rajasthan*, Vol I p 59.

COMARASAMY, a hill south of Ramanulai hill, 30 miles west of Bellary overlooking the valley of Sindoor.

COMAREE RIVER is crossed at Ahmednagar, 80 miles from source, and at Kolahat, 41 miles from mouth, by fords during the dry season, and ferries during the rains.

COMARI is mentioned in the Periplus. It is the Cape Comorin of Europeans. See Kammur.

COMARIKA. SINCH Aloes

COMATTI KIRAI. TAM *Celosia nodiflora*.

COMATULÆ, the Feather stars of naturalists, are found in the Eastern Seas. *Coll*.

COMBACONUM, in Tanjore, a large populous town. It was, in ancient times, in the territories of the Chola kings who were settled in Tanjore and Combacorum, in and near the Cauvery and Coleroon rivers, and as some suppose, gave then name to the Comorin Coast.

COMBERVERE, LORD Stapleton Cotton began his career when Louis XV reigned in France. He lay down to his rest while the hen of the man against whose legions he struck such weighty blows was the acknowledged and unquestioned occupant of the throne. Lord Combermere accompanied his regiment, the 6th Dragoon Guards, to Flanders in 1793. From the easy conquest of the Cape he proceeded to India, and he was in command of the 15th Light Dragoons in the year 1796. His squadrons, led with the brilliant energy which distinguished his operations, bore no small part in the great war which Tipu Sultan provoked, and at Mullavelly and Seringapatam he confirmed the good opinion which had been formed of him in his previous service. Coming home full of honour—a colonel after ten years' service,—he married the eldest daughter of the third Duke of Newcastle in 1801, and after six years of comparative inaction, he joined the expedition against the French in the Peninsula, and at the head of his brigade of the 14th and 16th Light Dragoons showed at Oporto and Talavera what British cavalry can do when properly handled and led by a congenial spirit. Indeed, so thoroughly was his talent appreciated by the Duke of Well-

ton and by the Government that in 1809 Sir Stapleton Cotton was created locally a Lieutenant-General, and placed at the head of the whole allied cavalry. The historian of the campaigns which ensued celebrates on many an occasion the vigilance, courage, enterprise, and skill with which the task conferred on Sir Stapleton Cotton was fulfilled. Whether covering a retreat or leading an advance, on out-post duty, in guarding the rear or watching the flanks—whether in the charge, in the pursuit, or on the defensive, the British horse did their duty. In all the long series of actions which marked the varying fortunes of those famous campaigns, Lord Combermere was careful of horses and men, and taught himself to restrain the hot counsels of his youthful bravery and to turn them to practical utility. The despatches of the period show what he did in the retreat from Almeida, at Busaco, Fuentes d'Onor, Salamanca, El Bodon, the Pyrenees, Orthes, and at the battle of Toulouse. For his services in the Peninsula he was created a peer and received the thanks of the British Parliament. In 1814 he married Miss Greville, and he became a widower for the second time 33 years afterwards. Lord Combermere went to the West Indies after he had finished his Spanish career, and conducted himself with prudence and ability as Governor of Barbadoes in 1817, and as Commander-in-chief of the forces in the islands at the end of the American war. But long after the great European war was over he took to the field in India once more, and in 1825 he dealt the death stroke to the great native confederacy which had for many years struggled to maintain its independence or to subvert British power. When Bhurtpore fell, a stain was wiped from British arms, and the people of Central India were taught the lesson which it needed some years to teach the Affghan and the Sikh. For more than 40 years afterwards his sword was sheathed, but the British nation did not prove careless of the old soldier's presence, nor the authorities indifferent to his services. It was the delight of the new comer to London to see in Rotten-row the upright figure of the old man dressed to perfection and mounted beyond his years, whose name was so well known as that of the good swordsman and soldier of half a century ago, and to mark him in all state pageants and court ceremonies, bearing himself as bravely as any new belted knight fresh from his virgin field—*London Times*

COMBOY SINGH A waist cloth resembling a petticoat worn by the Singalese

COMBRETACEÆ R. Br. A natural order of plants, the Myriobalan tribe, con-

sisting of trees or shrubs, simple or climbing, of 22 genera, and about 140 species, four of which are in Madagascar, two are in Bourbon and Mauritius, one in the Society Islands, two in China, and sixty-four in the East Indies. Of the last, there are twenty-three *Terminalia*, twenty-five *Combretum*, two *Poirrea*, two *Getonia*, two *Quisqualis*, four *Anogeissus*, two *Lumnitzera*, one *Bobba*, one *Sphalmithus*, one *Cerrostachys*, and one *Agatisanthus*. *Terminalia bellieria* gives a strong good serviceable wood, where elasticity and strength are required. The withes of two species of the *Combretum* are extensively employed in the place of iron stretchers for the months of the leatheren sacks used in drawing water from wells. Several species of *Combretum*, *C. ovalifolium*, *rotundifolium*, *costatum*, *acuminatum*, *Chinense* and *extensum* occur in parts of India. *Combretum Wightiana* is a fragrant flowered species, common on the hills near Moulinein, a straggling shrub, with winged fruit—*Mason Voygt 34 Revb n 226-7-8*

Combs for cleaning and adjusting the hair are formed of horn, bone, tortoise shell, wood, &c. In Ceylon the marginal pieces of tortoise-shell are used at Point de Galle in the manufacture of bracelets, and necklaces formed of a chain of shell, resemble amber in appearance. These bear a higher price than such as are formed by the darker shell. In Ceylon there is a great demand for tortoise shell for the manufacture of combs, which are worn by men as well as women among the Singalese. In the numerous excesses into which European costume has been carried the size of the back comb worn by ladies has never attained that of the Singalese men, who also wear a narrow, long bent comb across the forehead of the head—the lighter colored shell is most esteemed by them. Five pounds is a moderate price for a tortoise-shell back comb, which increases in value according to the size and quality of the shell. Hair pins of tortoise-shell are worn by the women, gold and silver being substituted for full dress. These hair pins are among the articles purchased by passengers—*Faulkner Rhode MS McCulloch's Commercial Dictionary, p 364*

The compass is, at present, used for nautical purposes by the principal native traders of Southern and Eastern Asia, and of the Archipelago. The Bugis of Celebes, for example, use small rude compasses, made expressly for them by the Chinese of Batavia, at the very moderate cost of from one shilling to eighteen-pence apiece. The directive power of the magnet is said to have been known to the Chinese for many ages,—by their own account, no less than 634 years before the birth of Christ. Their knowledge of the magnet is supposed to have led them to a knowledge of the compass, and the mariner's compass was invented by the Chinese in the reign of Hoang Ti. The subdivisions of this nautical instrument as made by the Arabs, the Chinese, and the Maldives, all vary. The Malay compass is divided into sixteen parts, twelve of which are multiples of the four cardinal points. For the cardinal points the different nations have native terms, but for nautical purposes, those of the Malay language are used throughout, as in the case of the nations of Celebes, the most expert native navigators of the present day. The introduction of iron ships has materially affected the value of the compasses on board of them, the variation being as much as five points, even up to 21° and 35°. The sole apparent remedy for this—but it is one of easy application—is to erect a high platform, 15 feet high over the taffrail on which to place the compass, and to examine repeatedly.—*Crawford's Des Dic of the Indian Islands*, p 116 *Bunsen*, in

383 *McCulloch's Commercial Dictionary*, p 381

COMPOSITÆ VARIL A very extensive order of plants, now known as *Matricariacæ*. DeCandolle enumerates 898 genera with 8371 species, of which 908 are known to occur in the south and east of Asia. Amongst these are *Calliandra*, *Cineraria azurea*, *Centaurea*, *Chrysanthemum*, *Cladanthus*, *Coreopsis tinctoria*, *Cosmea bipinnata*, *Costus patchuk*, *Coinla*, *Dahlia variabilis*, *Elephantopus*, *Empatorium*, *Humea elegans*, *Juncea*, *Podolepis gracilis*, *Rhodanthe*, *Telekia*, *Zinnia*, &c — *Voigt*

COMPOSSO DE MAREAR, *Port* *Compass*

COMPOUND This Anglo-Malay word is a corruption of the Malay *compong* or village, and properly alludes to the houses of the servants which are erected within the enclosure. It is applied in almost the same sense all over British India, where, however, some suppose it to be derived from the Portuguese word *Campagna*. Another writer says it is from the Portuguese word "*Componze*" and another *Compinho*, and applied by the Europeans of India to the grounds or enclosure in which a house stands. The Malay word *Compong* is doubtless the source.—*Earl Sur*

COMPRADORE, ANGLO-INDIAN A *pui-veyoi*, in China, an accountant

COMPTI, *Koripti*, *Komatti MAHR TAM TLL*, in the peninsula of India, persons engaged in trade, generally shop keepers and general merchants, and commonly recognised to be *Vesya hindus*, they wear the sacred string or *zonal*. COMUTTIMADALAH PALLAM? *TAM* *Citrus medica*

CONAJI ANGRIA, a person of low origin who long carried on a political warfare on the western coast of India, and rose to princely power. *Ghera* was his head-quarters, but *Severndroog* and every creek were fortified. *Ghera* was captured by *Clive* and *Admiral Watson* in 1755. See *Angria*

CONCAN a small narrow strip of land lying between the western ghats and the sea coast. The low land in the *Concan* and *Guzerat* is traversed by many rivers and smaller streams running to the sea, and is indented by numerous creeks and channels of the ocean. The cold weather is clear and bracing, but the hot season of April and May is succeeded by the deluging rains of the south-west monsoon, when 150 inches fall from June to September, and render much of the already humid lands impassable swamps, the atmosphere is

then very damp, and the sensation experienced is similar to that in Calcutta at the same period of the year. The Concan districts extend from Goa to Diu, or very nearly to the Tapti river. Lake Malabar, which it greatly resembles in general aspect, it is comprised between the western ocean and the ghats, and consists of a narrow belt near the sea with salt-water inlets, and a succession of mountain spurs. In the northern parts of the Bombay Presidency, the chain separating the Concan from the Dekhan is called the Northern Ghats, or Syhadri mountains, a term which may conveniently be extended to their whole length. Throughout the Concan the Syhadri form a continuous chain of hills, interrupted, however, by deep depressions. Their summits rise to the height of 4000—5000 feet, but the mean elevation is very much less. The station of Mahabaleshwar is 4700 feet. In the latitude of Daman  $20\frac{1}{2}^{\circ}$  N, the chain begins to sink abruptly into the Tapti valley, and changes its course, or sends off a spur of considerable elevation in an easterly direction, as the Chandor hills. At Mahabaleshwar, the rain-fall amounts to 248 inches annually. In the Southern Concan, especially in the Sawant War district, the rains are as heavy as in Canara. At Bombay, the rains last from June till the end of September, and the fall is only 80 inches, which is considerably less than any point further south on the coast. At Tannah, however, the average fall is more than 100 inches. In the Bombay Presidency, the provinces of Aurungabad and Bejapore are divided into two portions, termed the Poona and the Southern Mahratta districts, the latter with its head-quarters at Belgaum, but to each of these two divisions there is likewise allotted the command of the immediately adjoining portions of the level land of the Concan. The Belgaum Division of the army, in the province of Bejapore, is from 2,500 to 3,000 feet above the level of the sea, but has had soldiers on the sea shore at Kolapoor, Sawantware, Malwah, Vingola and Rutnagherry. The Poona Division is similar to that of Belgaum in the distribution of its force, of the soldiers in the command nearly the whole of them are in the provinces of Aurungabad, from 1,700 to 2,300 feet above the level of the sea. In the table lands above the ghats, the climate is more dry and the rains and temperature moderate, the range of the thermometer being from  $55^{\circ}$  to  $92^{\circ}$ , and the troops, European and Native, in the Poona Division particularly, enjoyed comparatively good health.—*Hooker & et Thomp*

**CONCH OR CHANK SHELL** These and their uses have already been noticed under the heads Bracelet and Chank, to which reference can be made. The manufac-

ture of rings for the arms and ankles from conch-shells imported from the Malayan Archipelago, is still almost confined to Dacca. The shells are sawn across for this purpose by semicircular saws, the hands and toes of the workmen being both actively employed in the operation. The introduction of circular saws has been attempted by some European gentlemen, but steadily resisted by the natives, despite their obvious advantages.—*Hooker Vol II page 254* See Chank

**CONCHA FLUVIATILIS**, Sea-shell is used by the bramins as a medicine, and with the common people, this fresh water river shell serves for a spoon, out of which they take their medicine.—*Hongberger, p 260*

**CONCHIENILJE** DUT Cochineal

**CONCHIFEROUS MOLLUSCA.** See Chamæca Chamædæ

**CONCHIFERES MONOMYAIRES** See Chamaea, Chamaeæ

**CONCH PALLAM** TAM Linomia pentaphylla

**CONCHOLOGY** A branch of natural science which teaches the form and structure of shells, the hard outer covering of molluscs. See Mollusca

**CONCUBINAGE** is very common all over India, amongst all religions. It is more particularly prevalent in great towns and in places where, from any cause, the people are necessarily absent from their families and native towns.

**CONDA CASHINDA** TEL Toddaha aculeata

**CONDA-THANA-KAIA** TEL Sterculiafolis digitatis

**CONDA TANGEDU** TEL Mimosa xylocarp

**CONDEMIR** The Takhilus or literary name, of Ghias-ud-din bin Ho-u-mam-ud-din. His book is entitled Habib-us-sayyid fi Asnad-ul-Bashar, that is to say, "the curious part of the Lives of Illustrious Men." It is a history which he extracted from that which his father Mircond had composed, and entitled Kauzat-us-Safa, but to which he made augmentations. He dedicated this book to the Secretary of State belonging to the king of Persia, shah Ismael Saffavi, who gave him the name of Habib-Ullah, and for that reason the book had the name of Habib given it in the year 1508, Heg 927, in the reign of Lewis XII. He was also author of another History, which is entitled Khulasat-ul-Akbbar, or the cream of histories.—*History of Genghiz Khan, page 422.*

**CONDIMENTS** Aromatic barks, roots, seeds, and spices are numerous as condiments in South Eastern Asia, are found in every bazar, for domestic use, and some of them are largely exported. The following are the better known

Botanical Names	English Names	Part used
<i>Allium sativum</i>	Garlic	The bulb
<i>Achillea officinalis</i>	Angelica	The root
<i>Areca catechu</i>	Areca nut	Calcepinu
<i>Capsicum</i>	Capsicum, Bird pepper, large or hill pepper, shrubs	The fruit
<i>Cassia filiformis</i>		The plant
<i>Cicca disticha</i>	Long leaved Cicca	Fruit
<i>Chavica Roxburghii</i>	Long pepper	Dry fruit
<i>Crocus sativus</i>	Saffron crocus	
<i>Curcuma longa</i>	Turmeric	The rhizome
<i>Cuminum cyminum</i>		The leaf
<i>Citrus bergamia</i>	Beigamot Citron	The fruit and rind
<i>Carum carui</i>	Caraway	The fruit
<i>Coriandrum sativum</i>	Coriander	Do
<i>Cuminum cyminum</i>	Cumin	Do
<i>Capsicum annuum</i>	Common Capsicum	
" <i>baccatum</i>	Bird pepper	
" <i>grossum</i>	Large capsicum, Bell pepper	
" <i>frutescens</i>	Shrubby capsicum, Guinea pepper	
" <i>minimum</i>		
" <i>neglensis</i>		
<i>Caryophyllus aromaticus</i>	Cloves	
<i>Coffea arabica</i>	Coffee	Keetamboo
<i>Carthamus tinctorius</i>	Safflower	
<i>Chavica Roxburghii</i>	Long pepper	
<i>Allettia cardamomum</i>	Cardamoms	Yalam
<i>Foeniculum panmorium</i>	Indian fennel seed	The fruit
<i>Garcinia purpurea</i>		The rind
<i>Garcinia pinnata</i>		Ripe fruit
<i>Illicium anisatum</i>	Star Anise	
<i>Mangifera indica</i>	Mango	Unripe fruit, fresh and preserved
<i>Mentha piperita</i>	Peppermint	
" <i>pulegium</i>	Peppermint	
" <i>cativa</i>	Ball red mint	
" <i>viridis</i>	Spear mint	
<i>Moringa pterigocarpa</i>	Horse radi h tree	The root
<i>Laurus cinnamomum</i>	Cinnamon

CONLY Paleontologists have pointed out the curious fact that the Hyrax called 'coney' in the Bible, is really only a diminutive and hornless rhinoceros. Remains have been found at Eppelsheim which indicate an animal more like a gigantic Hyrax than any of the existing rhinoceroses. To this, the name of *Acerotherium* (hornless beast), has been given.

#### CONFECTION OF BLACK PEPPER

In compounding this drug in India, for elecampane root (*Inula helenium*), Dr O'Shaughnessy recommends the substitution of the goonch root, *Abies precatorius*, the Edinburgh Pharmacopoeia uses liquorice root, and for the fennel seeds of the London preparation, the seeds of *Panmhoron*, or Sonf, (*Foeniculum panmorium*) are an adequate substitute — *Beng Phan p 273*

CONFERVÆ abound in the warm water of the hot springs of Soorjkhund, in Behar, and two species, one ochreous brown, and the other green, occur on the margin of the tanks themselves, and in the hottest water, the brown is capable of bearing the greatest heat, and forms a belt in deeper water than the green both appear in broad luxuriant strata, wherever the temperature is cooled down to 168° and as low as 90° — *Hooker Him Jour Vol 1 p 21*

CONFLUENCE, or fork of two rivers, Sangun HIND The hindus esteem all such places holy.

CONFUCIUS, whose Chinese name is Kung Fu Tze, was the founder of the school of philosophy in China, which contains injunctions as to conduct, and may be termed the moral code of China, in which learning (*Wen*), civility, good-breeding and propriety (*Li*), doing as you would be done by (*Shu*), sincerity in worship of the deity (*Tien*), are every where inculcated. He never claimed the possession of supernatural power, and invariably reproved all who attributed such to him. Every word he uttered has become in China a maxim, a proverb and an aphorism, and in the fact that his language is intelligible to every Chin-

man at the present day, his menitions are of greater power than the Latin or the Greek, both unknown to their descendants. Once he was asked, whether there were one word which represented all the duties of life, he answered "Shu", a word which Confucius and his commentators have explained to mean, "as I would not that others should injure me so would I not injure them also." To seek the good of others equally with your own, is to fill a large portion of the field of virtue. The number of his disciples was about 3000, of whom about 72 were his more intimate associates. All his teaching consists of a few simple words, one of his aphorisms, "Chin Chung sin," verbally, "Head, faithful, sincere," mean that fidelity and sincerity are the paramount or primary virtues. Another is that Wen and Li make up the whole sum of human excellences. "Lun yü" judge others indulgently, yourself severely. Confucius was a sage and a statesman. He and Lao Tze were contemporaries. Lao Tze was the founder of the Taoist or Reason Sect. He was a hermit, an ascetic who discouraged acceptance of public employments, he made reason the groundwork of his doctrine, and they have much to recommend them, but his teachings have merged into gross idolatrous rites, the study of astrology and necromancy, fanatic observance self-inflations, such as dancing in flames, mutilating the body, practising abstinence and seclusion.

Among his other celebrated literary labors undertaken in B.C. 490 and the following years, he edited the Yih king, and appended those annotations which have given the work its subsequent value. What philosophical views may have been attached to the Yih king of Wu-wang and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius viz the Shoo-king and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-he himself, have been preserved. It is these circumstances which constitute the labors of Confucius, the commencement of a distinct literary epoch. Apart from the labors of Confucius himself, the permanent literary results of this, the first of the two great philosophic or literary epochs of China, are contained in the collection of works called the

Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius (Meng-tse), a philosopher who died in B.C. 317, and closed the first epoch. The Chinese people are in nowise prohibited from worshipping in the Buddhist and Taoist temples, in other words, they may regulate their purely religious life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion, and, in the form of philosophy or morality, extend their direct influence into the domain of the social sciences and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles, it is by them also that the more important acts of the private life of the Chinese are regulated, as for instance marriages. The cause of the prevalence of mahomedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature, the desire to reverence, and the longing for immortal life. That it has notwithstanding its want of these holds on the human heart, maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as thorough soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy, must be understood Confucian philosophy, and by Chinese morality, the moral principles rooted in that philosophy.

The works of Confucius, which are used by his followers, are called the "five canonical books," and are held in the greatest veneration. The whole tenor of these works indicate morality and sound political views, one political extract must suffice. Let those who produce revenue be many, and those who consume it few, let the producers have every facility, and let the consumers practise economy, and thus there will be at all times a sufficiency of revenue." He was born B.C. 552, and died B.C. 479, aged 73 years.—*Bowring Sun's China and the Chinese, Vol. II. p. 146.* See Chün, Kung.

CONGANI, in the western parts of Tinnevely, a hood or pent house, made of reeds to protect the person from rain.

CONGEE In the neighbourhood of Maulmain and Amherst, but rarely in the southern provinces, the forest scenery is often ornamented with the numerous large purple bracts

surrounding the small inconspicuous flowers of a species of *Congea*. In the distance it bears a strong resemblance to the dogwood tree of the Ohio valley when in flower. There are three different species in the Tenasserim Provinces, *C. azulea*, *C. tomentosa*, *C. velutina*, all called ka-yau, the same Burmese name. The leaves of *C. villosa* have a heavy smell and are used medicinally—*Mason W. Ic O'Shaugh* p 486

CONGHAS, TAM *Schleichera trijuga*

CONGO A wood used in Madras for fuzes

CONICOPOLY TAM An accountant, from Kamka, an account, and kapila, a collector or supervisor

CONIFERÆ, a natural order of Gymnospermous exogens, called by Dr Lindley Pinaceæ, consisting of resinous, mostly evergreen, hard leaved trees or shrubs, inhabiting all those parts of the world in which arborescent plants can exist. In Sikkim and Bhootan there are twelve Coniferæ, viz., 3 *Juniper*, *Yew*, *Cupressus funebris*, *Abies Webbiana*, *A. Binnomiana*, and *A. Smithiana*, *Larch*, *Pinus excelsa* and *longifolia* and *Podocarpus neriifolia*. Four of these, viz., *Larch*, *Cupressus funebris*, *Podocarpus neriifolia* and *Abies Binnomiana*, are not common to the north west Himalaya, west of Nepal, but the other eight are common. Of the 13 natives of the north-west mountains again, only the following five, *Juniperus communis*, the *Deodar*, *Pinus Gerardiana*, *Pinus excelsa*, and *Cupressus torulosa* are not found in Sikkim. Dr Mason mentions the *Pinus* Latteri as growing in Tenasserim, and Dr Brandis adds, *Pinus Massoniana*, *Lamb*, and *Pinus Khasiana*. Thunberg mentions many pines in Japan, and they are numerous in China. The coniferæ of the Himalaya were described by Major Madden in 1846 to 1849. Dr Cleghorn gives the following description of those in Kullu and Kangra.

*Cedrus deodara*, *Deodar* or Himalayan cedar Keln, Grows on the north slope of Dhaola Dhar, and in Kullu.

*Pinus excelsa*, *Lofty pine*, *Kal*, grows in Kullu, not in Kangra.

*P. longifolia*, *Chil* or *Chir*, the long leaved pine. Grows luxuriantly on north slopes, timber best at 4-5000 feet.

*P. gerardiana*, *Gerard's*, or edible, pine *Neoz*. A few trees across the Dhaola Dhar, near Classi on the Ravi.

*Picea Webbiana*, *Webb's pine* or *silver-fir* *Tos*. The wood is not much valued, shingles are laid on the roofs of houses.

*Abies Smithiana*, *Himalayan spruce* *Rai*. The tree is often 100 feet high, and 5 feet in diameter.

*Cupressus torulosa*, *Twisted cypress* *Deodara*. At the head of the Parbati.

*Taxus baccata*, *Common yew* *Bramli* or *Rikhab*. In Kullu very scarce.

*Juniperus excelsa*, *Pencil cedar* *Lenu* or *Suri*. On the crest of Dhaola Dhar and in Lahul.

He is of opinion that plantations of the indigenous pines would not answer. At present we have no record of the growth of Himalayan conifers, but we know that they increase very slowly. Mr. Batten states "it is difficult in a garden, with every means of watering at hand, to show a good sized chin tree, *Pinus longifolia*, after ten years of care," and the Rev Mr. Parker thinks that *Pinus longifolia* trees of the diameter named below have the ages assigned to them or nearly so. Six inches in 20 years, nine in 30, twelve in 45, fifteen in 55, and eighteen in 70.

The distribution of the Himalayan pines is very remarkable. The *Deodar* has not been seen east of Nepal, nor the *Pinus Gerardiana*, *Cupressus torulosa* or *Juniperus communis*. On the other hand *Podocarpus* is confined to the east of Katmandoo. *Abies Binnomiana* does not occur west of the Gogra, nor the *Larch* west of the Cosi, nor *funereal cypress* (an introduced plant however) west of the Teesta in Sikkim. Of the twelve Sikkim and Bhutan Coniferæ (including *yew*, *juniper* and *podocarpus*), eight are common to the North-west Himalaya (west of Nepal) and four are not of the thirteen natives of the North-west Provinces, again, only five are not found in Sikkim, then names show how European, either specifically or in affinity, the absent ones are. I have stated, he continues, that the *Deodar* is possibly a variety of the *Cedrus* of Lebanon. This is now a prevalent opinion, which is strengthened by the fact that so many more Himalayan plants are now ascertained to be European than had been supposed before they were compared with European specimens, such are the *yew*, *Juniperus communis*, *Berberis vulgaris*, *Quercus ballota*, *Populus alba*, and *Euphratica*, &c. The woods of several of the Conifera are called cedars. But, in India, the term *Bastard cedar* is applied to the *Guazuma tomentosa*. Dr Stewart gives the following Himalayan coniferæ.

*Abies smithiana* Wall

*Cedrus deodara* Loud

CONIUM MACULATUM LINN

Shokran	ARAB	Spotted Hemlock	ENG
Banj-i-rumi	"	Koueron GR	of DIOSC
Keeidmana of BOMBAY		Cicuti	LAT
Hemlock	ENG		

Dr Royle says there is little doubt of this being the *κωπειον* of the Greek, and the *cicuti* of the Romans, but it must not, from the similarity of name, be confounded with *Cicuta maculata*. *Cicuta virosa* occurs in Cashmere, where it is called Zahr googul or poison turnip, Salep e-Shaitan *Pers*, or Devil's Salep. Spotted hemlock is the shokran of the Arabs, who give kumun as the Greek name. It is found in Europe, east of Asia and America. It is of importance in medicine, and derives celebrity from being considered to have been used as the Athenian state poison, by which Socrates and Phocion perished. The extract of hemlock is employed as an anodyne in scrofulous or cancerous affections, in rheumatism, neuralgia, and painful ulcerations — *O'Shaughnessy*, page 371 *Royle*

CONJEE MARAM TAM ? A light red coloured wood of Travancore, specific gravity 0.650, used for furniture, &c

CONJEVERAM, a town west of Madras. It has a great pagoda which was taken by Clive on the 29th August and again in December, 1751, and again in 1752. It is known in the south as Kauchi. It is celebrated as one of the holiest of the Hindu cities of the peninsula of India, and it has both a Sarva and a Vaishnava temple. Conjeveram was the capital of the Chola kingdom, which held sway in the south of India, from the eighth to the seventeenth centuries, when Shahaji the father of Sivaji totally annihilated every vestige of their once great power. It was one of the most ancient and prolonged of all the Indian dynasties. See Hindu, Sri Sampiadaya.

CONJEE HINDI Properly Gauji Rice starch

CONKANI-HEMP *Crotalaria juncea*

CON-MOO BURM ? A tree of Tavoy, furnishing a good timber, used for buildings and boats.

CONNARUS CHAMPIONII THW A tree of the Central Province of Ceylon, growing up to an elevation of 4,000 feet — *Thw Enum Pl Zeyl I*, p 80.

CONNARUS MONOCARPUS LINN

Andersonia acuminata, Roxb	
" lanceolata, Rottler	
Anogeissus acuminatus Wall	
Yoong	BURM
Pichiman	TFL
Pachcha manu ?	"
Pishi	TEL
Panchi	

This is a large, very valuable, and plentiful timber tree, growing throughout the southern forests, along with the *Conocarpus latifolius*. In British Burmah it is almost equal to the *Terminalia microcarpa* in size and the regular growth of its stem. Its wood is reddish brown, hard and strong, its breaking weight being 262 lbs. A cubic foot weighs lbs 50 to 57, and in a full grown tree on good soil the average length of the trunk to the first branch is 80 feet, and average girth measured at 6 feet from the ground is 12 feet. It sells there at 12 annas per cubic foot. It flowers during the cold season. This tree is valuable on ac-

count of its wood, which is exceedingly like, and fully as strong and as durable, if kept dry, as the *C. latifolia*, but exposed to the water, it soon decays. Of course it is thus unfit for the marine yard, but equally fit for house building when it can be obtained straight, which is seldom the case. But for its weight, it would be most excellent timber—*Dis Mc Clelland and Brandis, Mr Rohde's MSS Voigt* See *Anogeissus acuminatus*

CONOCARPUS LATIFOLIA ROXB,

This large timber tree grows in the Dehra Dhoon,—in the Kennerly jungles, valleys of the Konkan rivers, on the inland Dekhan hills at Chillame and Chittagong. It is one of the largest timber trees that are found amongst that chain of mountains, on the peninsula of India, which separates the Circars from the Nizam's dominions, where it is a native. It grows in Ceylon to the north of Kandy up to 1,500 feet. It flowers during the cold season, in January and February. Its trunk is erect, straight, varying in length and thickness, the largest being thirty-five feet to the branches, and about six feet in circumference. In Coimbatore, it is a tall handsome tree, furnishing an excellent and very strong timber. The specimens tried there, though not the best, sustained 500 lbs. Dr Roxburgh speaks of it in very high terms. But Mr Rohde could not learn that its timber was to be found of any size or value in Rajanundry or the Masulipatam Circar, these being the only localities in which he had met with it in common use, and he thinks its wood is overestimated. He had seen many instances in which it has, though sound when put out, given way in buildings, and he had never seen it above a foot in diameter. On another occasion, Mr Rohde says, "if this be the wood known by the name of Seriman, given by Roxburgh, I must say I never met with any worthy of the character he gives it—it is the common timber of Masulipatam, where I never saw a log of a size exceeding 12 inches diameter. The Tamil name given by Dr Wight is that of the white Eugenia." Other notes in our possession describe this as a large tree in some cases, but the stem is often so deeply furrowed as to prevent it yielding a good plank. There is a fine specimen of this tree in the neighbourhood of Sydapet, near

Madras. It is found about the sources of the Concan rivers, Kennerly jungles, and on the inland Dekkan hills, where it has a stunted and gnarled form. Dr Gibson also says that in the Bombay forests, it varies in size from a scrubby shrub to a great tree, according to soil and situation, and it seems to be as common in the inland forests as it is in those of the coast. The wood is described also by Dr Wight as very strong. It is also tough, and hence is much in use for the wooden axles of carts. It is much used in agriculture and house building. This also is one of the trees which should be largely increased. Its timber is universally esteemed for almost every economical purpose, house building, shafts and yokes, and general use for railway purposes, and makes very good cabinet furniture. Towards the centre, it is of a chocolate colour and is exceedingly durable. For house and ship building the natives reckon it superior to every other sort. *Pentaptea tomentosa*, and teak excepted. Captain Sinkey writing from Nagpore, says it is a white wood with a heart of a dark colour, and somewhat like rosewood. Its average length there is 12 feet and girth 7 feet. It is so much prized by the natives of Nagpore for axle-trees, that but few trees are permitted to attain their proper growth. By all accounts, in Nagpore, about 20,000 axle-trees are made from this wood yearly. It is attacked by white ants. Though not obtainable in very large quantities, it ranks high as a rafter timber—*Dis Roxburgh, Gibson, Riddell, Voigt and Wight Mr. Rohde, Thwaites Captain Sinkey* See *Anogeissus latifolia*

#### CONOCARPUS MYSTIFOLIUM ?

Kardaher HIND ?

Under these names was sent to the Exhibition of 1862, as a tree of Jubbulpore, a tough wood, but difficult to work, tolerably abundant (similar to Dowrah), grows along the banks of the Nerbudda—*Cal Cat Ex* 1863

#### CONOCARPUS ROBUSTUS

Carbyah BURM

A very large and strong timber tree, growing plentifully in the Pegu, Tonghoo and Prome forests, along with teak. Adapted for fancy work and cabinet making—*McClelland*

CONNELLY, four distinguished brothers of this name served in India, Captain Edward Connelly, Captain Arthur Connelly, Captain John Connelly, and Henry Valentine Connelly, all of whom were cut off prematurely. Two of them having been killed in action and two of them murdered. Captain Edward of the 7th Bengal Cavalry was killed in battle in Afghanistan, October 1841. Captain Arthur Connelly was kept captive till his death or

murder at Bokhara in 1842. Captain John Connelly was killed at Cabool in 1842. These three distinguished brothers perished in Affghanistan within a year of each other. Edward was killed at Toolan Durrah, (Purwan Durrah?) October 1840, Arthur, the celebrated traveller, went on a mission to Bokhara in August 1840, and is believed to have been murdered in prison with Colonel Stoddard, John was killed at the capture of Cabool in July 1842. Their brother Henry Valentine Connelly, of the Madras Civil Service, was murdered at the instigation of Moplah fanatics.

Captain Edward Connelly wrote on the Physical Geography of Seisthan in *As JI* 1839, Vol IX, 710. On figures of gems and coins, in *Bl As Trans* 1842, Vol XI, 137. An account of the city of Oujen and its environs. *Ibid*, 1837, Vol VI 831. Journal kept while travelling in Seisthan. *Ibid* 1841, 319.

Captain J. Connelly wrote a Report upon Khorassan, *Bl. As. Trans* 1842, Vol XI 116.

Captain A. Connelly wrote on the White-haired Angora goat, *Lond As Trans* Vol VI, 159. Overland Journey through Persia and Affghanistan to India. *Lond* 1834, 2 Vols.

CONOPS, a genus of insects belonging to the order Diptera and the family Conopidae. — *Eng. Cyc* page 127. See Insects.

CONOSTOMA SEMODIUS. A Rasorial crow, sub-family Paridae, inhabiting the northern region of Nepal.

MOULE, Reverend, a resident in England, who proposed the introduction of the dry earth sewage. It would be of enormous value in India, but its cost has precluded its general introduction. This was enjoined by Moses, and the deodorizing properties of earth have long been acknowledged and resorted to. Tainted meat is soon divested of any bad smell by being put a little while under ground.

Consists of rose-petals and sugar mixed in certain proportions, and bruised in a mortar. The conserve of roses met with in the bazars of Bombay, is chiefly obtained from Surat — *Faulkner*.

CONSERVE OF VIOLETS, "gulkand-i-banafsha."

CONSPIRINA VAGABONDA. See Temia.

CONSTABULARY has been extensively introduced in British India since the revolt of the Bengal Native Army, and to Mr William Robinson, C S I, of the Madras C S, the credit is chiefly due. In regard to two very important branches of the administration, education and Police, the credit is due to Mr. A.

J. Arbuthnot, C S I, and to Mr Robinson, C S I. Madras has a right to be proud, and a comparison with other Indian governments is all in its favour. At the commencement of 1862, the experiment of the introduction of the new Indian police, established chiefly on the model of the English county constabulary, was made in North Arcot, a single taluq of a Madras district. At the end of 1862 not a taluq or town in the entire length and breadth of the Presidency remained unoccupied by the new constabulary. Not a single soldier remained away from the regimental headquarters, in consequence of being employed on semi-civil duty. When disturbances took place in the hill country of the Ganjam district, tranquillity was restored by the Government Agent with the aid of the Police only. In like manner a similar outbreak in the Vizagapatam district was vigorously dealt and order was restored without the military. In accordance with the system of a purely civil police force, the whole of the jails and treasuries throughout the Madras Presidency have been guarded, and escorts of treasure have been supplied, by the new constabulary. During 1861-62 they escorted £6,000,000 of treasure, and guarded in the several jails of the Presidency upwards of 7,000 prisoners. The average cost of the Treasury guards is found to amount to 1½ pie per hundred rupees on the gross revenue guarded and escorted, while the cost of jail guards averages rupees 18 per mensem for each convict. The latter charge will be reduced by more than one-third when large Central Jails are completed. In addition to the ordinary jail duty, the police guard and superintend the convict labor of 150 subsidiary jails, without any increase to the establishment or cost to the State. The Meriah Sacrifice Agency, which cost the State a lakh of rupees annually, has been abolished, and its object secured by the employment of a special police force at the cost of 36,000 rupees per annum. Since the introduction of the new system, the graver kinds of crime have been successfully met. The total cost of the Madras constabulary is 35½ lakhs. For this sum of 3½d per head per annum, security of life and property is afforded to a population of nearly twenty-three millions, scattered over an area of upwards of one hundred and forty thousand square miles.

CONSTANTINE. See Aden, p 29.

CONSTANTINOPLE, a town in Europe, the capital of the Turkish dominions, which extend to the shores of the Indian Ocean. See Arabia, Ajem, Irak, Jews.

COOCH BAHAR, is a native state ruled by a rajah subject to the supervision of a British Resident. It is situated between Bengal and Assam, on the N E frontier of British India, and is separated from the highlands of Bhotan by the Dooars. Fallacotta is the most central town, for the Jungta, Chamoorehee, Bala, Bunna, and Beygoo passes into Tibet and Bhootan. The abolition of slavery in Cooch Behar has recently been formally proclaimed. Up till this proclamation, if a ryot or peasant owed a sum of money, and was unable to satisfy his creditor, he was compelled to give up his wife as a pledge, and possession of her was kept until the debt was discharged. It sometimes happened that the wife of a debtor was not redeemed for the space of one, two, or three years, and if, during her residence with the creditor, a family should have been the consequence, half of it was considered as the property of

the person with whom she lived, and half that of her real husband. The country has a most wretched appearance, and its inhabitants are a miserable and puny race. The lower ranks without scruple formerly disposed of their children for slaves, to any purchaser, and for a very trifling consideration, nor was the agency of a third person ever employed. Nothing was more common than to see a mother dress up her child, and bring it to market, with no other hope, no other view, than to enhance the price she might procure for it. *Turner's Embassy* p 11, *Treaties, Engagements, and Sunnuds* Vol VII p 367

### COOKIA PUNCTATA, RETZ.

Quinaia lausum, Lour

Whong-pi CHIN [ Wham-pi CHIN

This fruit tree is a native of China and the Moluccas. It is a middle sized tree bearing an edible fruit about the size of a pigeon's egg, yellow on the outside. The flowers are small, white and fragrant. The yellow and very agreeable fruit has a white pulp, rather acid but sweet, and which is much esteemed as an article of diet in China and the Archipelago.

There are two or three species, natives of the East, all known as Wampee trees. Hwangpi, or whampee, means yellow skin. In India it bears its rough skinned fruit in April and May. It grows in clusters, containing a sweetish acid juice, resembling black currant in flavour. The tree has very dark green shining leaves, it has ovate, lanceolate, leaflets, acuminate, hardy, unequal at the base, is rather ornamental, and requires very little care.—*Vogel Riddell*.

**COOKING WAGON** This is constructed somewhat like a battery caisson, so that the parts can be unhimbered and separated from each other. The "humber," or forward part, bears a large chest, which is divided into compartments, to contain coffee, tea, sugar, and corn starch, with a place also for two gridirons and an axe. From the rear portion rise three tall smoke-pipes, above three large boilers, under which there is a place for the fire, and under the fire a box for the fuel. Each boiler will hold fourteen gallons, and it is estimated that in each one, on the march, ten gallons of tea, or coffee, or chocolate, could be made in twenty minutes—thus giving ninety gallons of nourishing drink every hour.

**COOLEE**, a name in use in British India to designate any labouring man, working for hire, also, the hire itself. The word is a corruption of the Tamil word Woleeya or Wozheeya. Karen, a servant. Under this designation great numbers of the labouring classes of India have emigrated to Ceylon, the Mauritius Bourbon, and the West Indies.

The mortality on the voyage was so considerable, ranging up to 19 per cent that emigration agents were appointed at the Indian ports under acts of the Council to control the emigration.

COORBAN See Kurban. Sacrifice

COORG(Codagu) is a British district, administered by a Superintendent under the Chief Commissioner of Mysore It is situated in L 12° 26' 21", and L 74° 30' 46" It is bounded on the north by the Hemavati river, on the south by the Tambacheri pass, on the west by South Canara and North Malabar, and on the east by the Mysore country It is 60 miles long and 40 broad Coorg was surveyed by Lieutenant Connor of the Royal Engineers in 1817, who has written a very interesting memoir of the survey Of 2,400 square miles, 547 are cultivated, 1,705 culturable and 148 unculturable There are 168 miles of road The rain-fall varied in 1868 69 from 68 09 inches at Kembu Kolli in the south east to 95 25 at Mercara, the capital The maximum temperature at 3 P M in May was 83° and the mean 72° The minimum in December was 53° at 6 P M and the mean 65° The aspect of Coorg presents an entire forest, the long and narrow cultivated valleys enclosed within it, serve but to render those vast woods more striking The whole of the eastern boundary presents a remarkable line of demarcation exhibiting an almost uninterrupted and impervious wood from the Burmagery hills, till reaching the Cavery, this space is wholly uninhabited Advancing westward the woods decrease in density as the country improves in cultivation, and become gradually thinner till reaching the Western Ghauts, the immediate summits of which, partially bare of wood, are clothed with a luxuriant herbage The Mallimbi Peak lying on the confines of Yelusavira and Yeddavanad is an exact cone, Coorg Proper gives birth to the Cavery and two principal streams tributaries to it, the Soornawutty on the north and Latchmunteert on the south Neither of these streams are navigable in Coorg In its area of 2,400 square miles, it has a population of 115,357

There are thirty-five judicial and revenue sub-divisions, and 507 villages There are twenty-three magistrates of all sorts The total cost of local officials and police of all kinds was Rupees 1,14,578 in 1868-69 In that year the land revenue was Rs 1,68,108 and the gross revenue Rupees 5,08,143 The chief towns and their populations are

Mahadeopete . 3,825	Fraserpete . 1,109
Vijajapete . 2,889	Sanivarsante . 498
Somavarpete . 905	Kodlipete . 690

The prevailing languages are Coorg, Canarese, Malayalam, Tamil, Tuju, Hindustani and English. There are about 40,000 native Coorgs scattered throughout the country, and the number is believed to be decreasing The Coorg race are called Koodaga They are a tall, muscular, broad-chested, well favoured race of mountaineers They are a handsome and well made race, and are far superior in physique to the inhabitants of the plains, whom they greatly despise They are also far advanced in civilization and are very intelligent The morals of the Coorgs are scarcely any better than those of most other races, and the vice of drinking has a deep and widely-spread hold upon them They are divided into thirteen castes They marry at a ripe age, but the wives of brothers are considered as common property They generally retain the old devil-worship of the Scythian Dravidian race, from which they are descended Nearly all official appointments (of which there are a very large number) under the Superintendent, are held by Coorgs, including the highest one of Assistant Superintendent Mercara is beautifully situated in almost the very centre of the country, and is 4,500 feet above the sea level A regiment of native infantry is always quartered in Mercara, in a fort which was formerly the rajah's palace, and which is a very spacious and substantial building It is supposed to have been built for the rajah by an Italian, who is said to have suffered the usual fate of such pioneers of civilization, by being bricked up in a wall as soon as the building was finished Verajenderpet is situated on the road leading to Cannanore from Mercara, and is 20 miles from the latter place There is a cross road from Mysore, which joins the road to Cannanore a few miles below Verajenderpet, and along this road passes all the direct traffic between Mysore and the coast Fraserpet is situated on the road to Mysore from Mercara, and it is also 20 miles from the latter place The river Cauvery runs past Fraserpet, and forms the boundary between Coorg and Mysore. The S W monsoon, which always rages throughout Coorg from June to November, is scarcely felt at Fraserpet, and on this

responsible, and the Chetty are also responsible for their Paumer or farm slaves. The Coorumbur services are constantly called for by the wood contractor and the planter. They will not leave their haunts in the forests for any time. *C H S in Newspaper Cleghorn Forest Report*

**COOROOMINGA**, a beetle, the *Butocera rubus*, which penetrates the trunk of young coconut trees near the ground, and deposits its eggs near the centre. The grubs eat their way up and destroy the tree.

**COORU**, one of the great families who settled in Hindustan. Many of them dispersed over India and Central Asia, amongst whom may be placed the Ootooru Cooru (Northern Cooru) of the Poorian, the Ottorcooru of the Greek authors.

**COOSY**, a tributary to the Hoogly, also written Cusi and Kosi. It rises in the Ranghri district, lat  $23^{\circ} 35'$ , lon  $85^{\circ} 58'$  runs a circuitous course, but generally S E, into the Hoogly. Its length is 240 miles.

**COOT** *Fulica atra*

**COOTANAD**, a district of Malabar. See Kummaler.

**COOTE**, Sir Eyre, K C B, a British officer who served in the Carnatic from 1759, during the contests for supremacy between the British and the French. He was outmanœuvred on the Palai river, but in 1760, beat M. Lilly at Wandewash, recovered all the places in the Carnatic, and captured Pondicherry. He was a hardy, energetic soldier. He arrived in India in 1759, recaptured Wandewash, and in 1769 defeated MM. Lally and Bussy.

**COPAIFERA** Several species of this genus in the W Indies yield Balsam of Copaiva.

**COPAIFERA BIJUGA** See Copaiva.

**COPAIVA COPAIBA**

Baume de Copahu FR | Capayva SP  
Kopaiwa balsam GER

Copaiba is the fluid resinous exudation of several species of *Copaifera*, of *C. Langsdorffii* Dec., of *C. officinalis*. Copaiba was first described by Maregraaf and Piso in 1643, but the species is uncertain, as the latter gives no figure, and the former only one of the fruit (supposed by some to be of *Copaifera bijuga* Willd). Jacquin, in 1763, described a species of *Copaifera* from Martinique, which he named *C. officinalis*, and which probably yields the copaiba obtained from the West Indies. It has, however, been ascertained that several species yield the copaiba of commerce. The wood-oil of some species of *Dipterocarpus* yields a substance closely resembling copaiba.

*Faulkner Royle*, page 364. See *Dipterocarpus laevis*.

**COPAIVA LANGSDORFFII** See Copaiva.

**COPAIVA OFFICINALIS** See Copaiva.

**COPAL** This important resin exudes spontaneously from two trees, *Rhus copalinum*, and *Elaeocarpus copaliter*, the first being an American and West Indian, and the second an East Indian tree. Another variety of copal is obtained from the coasts of Guinea, and several species of *Hymenoclea*, on the Amazons, are said to produce kinds of copal. The American copal occurs in commerce in flat fragments, whereas the East Indian is generally obtained in roundish masses. The latter furnishes the finest varnishes. Fresh essence of turpentine dissolves it completely, but old turpentine will not do so. It is stated that essence of turpentine, digested upon sulphur, will dissolve double its own weight without letting any fall. The oil of rosemary also dissolves copal with great readiness. An excellent varnish may be made by dissolving one part of copal and one of essence of rosemary, with from two to three parts of pure alcohol. Copal is largely imported into Bombay from Zanzibar, the major portion of which is re-exported to England, and occasionally to France and Calcutta. Copal is liable to be confounded with anime, when the latter is clear and good, but the solubility in alcohol furnishes a useful test—the anime being readily soluble in this fluid, while copal is sparingly so. Copal is also brittle between the teeth, whereas anime softens in the mouth.

**COPAL VARNISH** is a solution of the copal gum resin in equal quantities, and linseed oil, oil of turpentine, spirits of wine or alcohol, it is used for japanning snuff-boxes, tea boards, and similar articles. Copal varnish and amber varnishes are also much employed by the artist and by the photographer for the preservation of their works. The latter is perhaps superior to any of the other. Far less attention is paid to the peculiar properties of varnishes than could be desired. The artist employs a varnish for the purpose of securing his labours from the combined influence of light and air, but it must never be forgotten that he is employing a material which is itself constantly passing by the absorption of oxygen, into a state of disintegration. We know that many varnishes rapidly change colour, and that some are more liable to crack than others are. A few preliminary experiments may be made of great value. For example, if portions of various samples of varnish are spread upon a plate of glass, and dried, we have the means of determining many important points. Cover

one half of the varnished glass with an opaque screen, and expose the other half to sun shine day by day, by placing the glass upon a sheet of colourless paper, it will be seen whether any colour has been imparted by the action of the sunshine. After a few days, if the whole arrangement is placed in spirits of turpentine, the varying degrees of solubility may be noted, and from this may be determined the rate at which, under ordinary circumstances, oxygen is absorbed—the rate, indeed, at which the elements of destruction proceed. Thus a considerably greater degree of permanence may be secured, than when the artist, trusting only to the varnish maker, employs a preparation about which he knows nothing—*Robert Hunt, in London Art Journal of December, 1858 Binylow III 83*

**COPALITE**, or mineral copal, is found in ligniform pieces near Quilon, under laterite. It is also dug out of the earth in the western part of tropical Africa, from sandy soil with thorny bushes, and the only large tree growing is the *Adansonia*. The digging is from two to ten feet or more, and it is found in various shapes and sizes, from a hen's egg to a child's head. Of the three colours, yellow, red and white, the first makes the best varnish, and brings the highest price.

**COPALM BALSAM** is a product of the *Liquidamber styraciflua*.

**COPARI**, properly *Cobbari tengai*, *TAM* *Copia*, kernel of cocoa nut.

**COPAUDROOG**, taken by storm on the 14th May 1819.

Copper, gold and silver are the most anciently known of the metals. Copper is abun-

dantly diffused in nature, being found native as an oxide, a sulphuret, a sulphate, carbonate, arsenate, and phosphate. Copper is found in Persia, India, Sumatra, Borneo and Japan. Copper ore in the form of sulphuret is chiefly abundant in Rangurh in Shekawattie near Ajmeer the carbonate of copper is found in small veins, and in connexion with ores of iron—(*Genl Med Top p 169*) A silicate of copper occurs in Nellore collectorate, but not in workable lodes. Copper ores are found in the Jeypoor dominions, and in the vicinity of Nejeebabad, Nagpore and Dhumpore, places lying betwixt forty and fifty miles east of Snnagur, two copper mines are worked during eight months of the year. A copper mine was discovered by Mr J B Travers, then Collector of the Ongole district, betwixt Poodala and Ardanghuc, which, for a short time, attracted notice, but seems to have fallen into disuse. The produce was a variegated purple ore, containing a considerable portion of iron. Captain Arthur of the Corps of Engineers mentioned to Dr Ainslie, that the green carbonate of copper called malachite, is a product of Travancore, but of late this has not been heard of. The copper ore of Japan is certainly the finest in the world, and is an article of trade from the island. Copper is also found in Tibet, in the Burman dominions, in Nepal, and in great abundance in Sumatra, where it is by all accounts combined with much gold. By Le Gentil's description of the Philippine islands, this metal is common. Dr Hefser says that the copper on the Lampa Islands is worthy of attention. Mr O'Riley states that specimens of copper ore have been brought from several islands of the Meigu Archipelago, all of the same character, viz, the grey copper ore containing from forty to fifty parts of the metal in combination with antimony, iron, and sulphur. He has also traced the existence of the sulphuret of copper on the Ataran, and Dr Mason had a fine specimen of the green carbonate, or malachite, brought him by a Burman, who said he received it from a Karen who represented that it was found near the head-waters of the Ataran, and other natives have assured him that the same mineral exists up the Salween. The blue carbonate of copper is seen in the same specimen united with the green carbonate. The natives say it is found in Province Amherst, but he has seen it only in specimens from Cheduba near the coast of Annam (*Vason*). Copper ores have been found in Sumatra, Celebes, and Timor. In the two former, mines of it are said to be worked, but if such be the case, even their locality has certainly never been shown. The probability is that this metal has always been,

as it now is, imported. The prevailing name for it is tambaga, a corruption of the Sanscrit *tamra* (*Crawford Dict* page 116). It has been discovered in the island of Borneo, and it has been long known to exist in Sumatra and Timor. The utensils made of this metal in those islands always contain some iron, and the bars or cakes into which it is cast when sold for unalloyed copper, require much labor to make them pure and malleable. The copper found in Japan contains gold in alloy; it occurs in the market in small red bars, six inches long, flat on one side, and convex on the other, weighing 4 or 5 lbs each; this copper is the most valuable of any found in Asia. The Chinese and Dutch exported upwards of 2,000 tons annually. South American copper is brought to the China market, and from England and the United States, but it is scarcely ever landed, much of that in slabs is sent on to India, and that in sheets, rods, and bolts is used by the foreign shipping. There is a natural alloy found in China, known under the name of white copper, which is used by the natives in great quantities, and prevents the consumption of foreign copper. The constituents are not known, but copper and iron are probably the chief. It is a singular mineral, seems peculiar to China, and has been supposed by Dr. Black to owe its distinguishing colour to an alloy of nickel, (*Linn's Mat Med* page 53). It is used for dish covers, candlesticks, tripods, plates, &c. &c., which when new and polished, look almost as well as silver. Acetate of copper (arugo, verdigris) is, like the sulphate, a common bazar article in India. Verdigris is prepared on a large scale by strewing copper plates with grape husks. During the fermentation of the traces of sugar in the husk, the copper combines with oxygen, and the oxide with acetic acid formed by the grape sugar. The process is extremely tedious. A very good article can be made by using tamarind pulp instead of the grape—(*Beng Phar* p 324).

Copper has been discovered in Singhnah in mines in Kumaon and Gurwhal, at Pokree and Dhanpore in the territory of Luz near Bela in mines of Deoghur at Danjeeling, at Ajmii. Copper mines occur at Papulee, Pringlapani, Murbuggettee, and old mines at Keriaye, Belai, Raie, Seera Toma Cottee, Dobree and Dhanpore. Rich veins of copper ore are said to occur about 80 miles from Amarapura. In the *Beng As Soc. Jour* No. 1 of 1851, p 1, mention is made of the copper of Deoghur or Byjnath, a small town in zillah Beerbhoom. The surface veins run east and west, and present the ore in irregular masses of  $\frac{1}{2}$  of an inch broad, so much corroded by atmospheric influence as to ap-

pear in a soft, friable, red, yellow, and liver-coloured or garnet-coloured earth, but upon digging a couple of feet below the surface of the ground, the veins become a compact liver-coloured mass, spangled with shining particles of copper, the whole enclosed in a soft friable apple-green, yellow or white felspathic rock. Traversing the copper from north to south small veins of lead appear, which occasionally form the containing walls to the copper. Mr Vincent traced the vein of copper for about 100 feet east and west, and dug to the depth of two feet only. With the aid of coal, dug from Banslee Kullah in the Rajmahal hills, he smelted some of the ore, which gave a return of 30 per cent of good copper, inferior specimens, mostly water-worn pieces picked up on the surface, gave 25 per cent.

The mountainous parts of Nepal are rich in mines of iron and copper. The produce of the former is smelted in other hills than those where the ore is found. The copper is of a very superior kind, and before the opening of a trade between England and India, was preferred for consumption in the territories of the king of Oudh to that exported from Britain. Its supersession by the European product, doubtless arose from the difficulty and expense of transportation through a mountainous tract, having no navigable rivers, and the ignorance of the Nepalese in the arts of mineralogy and metallurgy. Lead mines, yielding also a proportion of silver, are to be found in Moulkote, and it is supposed that there are gold mines to the north, though as yet no traces of gold have been discovered excepting in the beds of the torrent which rush through Kaehar to the eastward. Copper has been pointed out near Beila, in the province of Luz, on the western frontier of Lower Sind, by Captain Del Hoste and Captain Harris, in Kumaon, by Lieutenant Gasford and Captain Durand, at Poonkee and Dhanpore, by Captain Richards, at Almorah and in Afghanistan, by Captain Drummond. It is said to have been worked in Cutch, and to occur on the Neilgherries and near the Poondah Ghaut (*Smith's Nepal Bombay Times*). At Kotah, the coal-field is about  $1\frac{1}{2}$  mile in width from east to west, that is, so much of it lies within British Sigowlee. To the north it reaches to within two miles of Oondlee, or about ten miles, and although not free from faults and dislocations, ten miles west of Palgunge (that village being eight miles south of Kirkur-baree) near to the village of Bugundah, copper ore is to be found. The people at the village have a tradition that long ago copper in large quantity was obtained from the mine.

A shaft was once sunk to a depth of seventeen feet and then abandoned—*Smith's Report of the Sigrowlee and Karkhurbaree Coal-fields*, p 10

Copper is dug from the mines of Keban and Arguna, situated in the two branches of Mount Taurus that enclose the valley of Lophene

Copper ore is said to occur in an island, just below Yelguriup in the Rangir circar of Hyderabad. Copper ore occurs in Kumaon. From Gurgaon, there was sent to the Panjab exhibition a piece of copper pyrites, which is a usual ore of this metal. Also specimens of good copper ore from the Hissar district, and of the metal got from it, from Pelang in Kulu and from Maunkaru near Kulu in the Kangra district, some copper pyrites, and blue carbonate of copper from Spiti. From Rondu, 16 marches beyond Kashmir, copper glance, copper is found in Kashmir but is not yet an article of trade

The primary formations of the Australian continent are equally metalliferous with those of south-eastern Asia. Copper ores have been found as long ago as 1802 at Port Curtis, near the southern extremity of the range which extends along the north-east coast. Flinders met with indications of copper at Good's Island in Torres Strait, but his suggestion does not seem to have been followed up by the naturalists attached to subsequent expeditions (*Flinders' Voyage to Terra Australis*, Vol II, p 120). Lead and copper mines have been worked in South Australia for some years past, and others have been opened recently in the western coast range, a little to the north of Swan river. Hematitic and specular iron ore and copper pyrites, have been found on the north west coast near Admiralty Gulf—*Kimber's Geographical Memoir*, p 258. *McCulloch's Commercial Dictionary*, p 398. *Bombay Times*, June 19, *Piddington in Beng As Soc Jour*, *Crawford's Dictionary*, *Mason's Tenasserim*, *Irvine Gen Med Top of Ajmer*, *O'Shaughnessy, Beng Pharm Beng As Soc. #### COPPER, ACETATE OF

Zanjur	ARAB	Senan	Malay
Theng twa	BURM	Tribembaga	"
Pitra	HIND	Zangar	Prns
		Vangala Patchi	Tan

COPPER ALLOYS are largely used in India, alloyed with zinc, brass, tin and lead. The red color of copper slides into that of yellow brass at about 4 or 5 oz to the lb, and

remains little altered to 8 or 10 oz, after which it becomes white. The alloys from 8 to 16 oz are much used for furniture work. In all cases the metal is annealed before the application of the scouring or cleaning process. The alloy of zinc and copper retain their malleability and ductility well to about 8 or 10 ounces to the pound, after this the crystalline character begins slowly to prevail. The ordinary range of good yellow brass that files and turns well is from about 4½ to 9 oz to the pound. The following proportions have been taken from C Holtzapfel's remarks. The quantities show the proportions to 1 lb of copper

Half to 1½ oz zinc is added to copper when used for castings as pure copper generally does not cast sound. The usual mode is by adding 2 to 4 oz brass to 1 lb 6 oz copper. Brass that bears soldering well, Bristol brass, is said to be of this proportion.

8 oz ordinary brass less fit for soldering than 6 oz, being more fusible.

9 oz to 16 oz Muntz patent sheathing 40 zinc to 60 copper is the best proportion, it is cast in ingots heated to a red heat, and at that heat rolled and forged for bolts &c.

12 oz spelter for soldering iron pale yellow metal for dipping in acids is in this proportion.

16 oz soft spelter solder for ordinary brass work, 2 oz copper to 1 lb zinc a hard crystalline metal used for laps, polishing disks, &c.

#### ALLOYS WITH TIN

The tin alloy is scarcely malleable at 2 ounces, it soon becomes very hard, brittle and sonorous, alloys of 1½ to 2½ easily assume the maximum of hardness without being crystalline. Native smiths render the mixed metal malleable with greater proportions of tin, so do the Chinese for their gongs and cymbals, by gently striking it while hot, at repeated heatings. Some years ago bronze sheathing for ships was prepared on the same principle. Natives call such malleable bell metal "akkansu" (Tel). It is formed into vessels for containing acid food, buttermilk, &c.

1 oz of tin to 1 lb copper—a soft gun metal

1½ „ harder, fit for wheels to be cut with teeth

1½ „ to 2 oz brass ordnance

2 „ hard bearings for machinery.

2½ „ very hard do

3 „ soft musical bells

3½ „ Chinese gongs and cymbals

4 „ house bells

4½ „ large bells

5 „ largest bells

7½ „ to 8½ speculum metal

#### WITH LEAD

1 lb of copper to 2 oz a red colored ductile alloy

6 oz common pot metal is brittle when warmed

The alloy with lead chiefly used on account of the facility with which it can be turned or filed

#### WITH ZINC, TIN AND LEAD

$1\frac{1}{2}$  oz tin,  $\frac{1}{2}$  zinc, 16 copper, pumps and works requiring great tenacity.

$1\frac{1}{2}$  tin and 2 oz brass to 16 copper, to be cut into teeth

$2\frac{1}{2}$  16 for turning work

$1\frac{1}{4}$  16 nuts of coarse threads and bearings

Melt the copper alone, the brass in a separate crucible, the tin in a ladle, the two latter are added to the copper when it is removed from the furnace, the whole are stirred together, and poured into the moulds

Ordinary yellow brass is rendered very sensibly harder by a small addition of tin, say  $\frac{1}{2}$  to  $\frac{1}{2}$  oz to the lb. On the other hand by the addition of a like quantity of lead, it becomes more malleable and cuts sharply. Brass becomes a little whiter for the tin and redder for the lead, the addition of nickel to brass constitutes German silver

Gun metal (copper and tin) by the addition of a small proportion of zinc mixes better, and the malleability is increased without materially reducing the hardness. Lead in small quantities improves the ductility of the metal, but at the expense of its hardness and colour, it is seldom added

Pot metal (copper and lead) is improved by the addition of tin, and the three metals will mix in almost any proportions. Zinc may be added to pot metal in very small quantity, but when the zinc becomes a considerable amount, the copper takes up the zinc forming a kind of brass, and leaves the lead at liberty, which in a great measure separates in cooling. Zinc and lead are indisposed to mix alone, though a little arsenic assists their union by "killing" the lead as in shot metal, antimony also facilitates the combination of pot metal, — 7 lead, 1 antimony, and 16 copper mixed perfectly at the first fusion, and the mixture was harder than 4 lead and 16 copper, and apparently a better metal — *M. Rohde MSS*

**COPPER SMITH** The small green Barbet, *Megaluma viridis*, *Gmel*. It is common in the peninsula of India, where it is known as the coppersmith. It generally perches on the top branch of a tree, and the sound of its voice is "took, took, took," continuously, almost identical with the sound produced by striking a metal vessel

sulphat of copper	"	Cupri Sulphas	"
Sulfate de Cuivre	FR	Tutashu, Nila	"
Kupfer Vitriol	GER	tutum	TAM

This salt is produced naturally in the water of many mines. It was no doubt employed by the ancients as it was by the Arabs and Hindoos. It is a common bazar article in India, being manufactured in many parts of Bengal and the eastern Islands, it is easily prepared by heating copper to redness in contact with the air, removing the black scales which form, and dissolving these in dilute and boiling sulphuric acid, and crystallizing. In the refining of silver it is incidentally prepared in very large quantities — (*Beng Phar* p 322) It is much used in dyeing operations, in the printing of cotton and linen, and for various other purposes in the arts. It has been employed to prevent dry rot by steeping wood in its solution, and is a powerful pre-ervative of animal substances, when imbued with it and dried, they remain unaltered. It is obtained by the decomposition of copper pyrites, in the same manner as green vitriol from iron pyrites. It is manufactured for the arts from old copper sheathing, copper turnings, and copper refinery scales. A little sulphate of copper or blue vitriol mixed with the rice or flour paste, used for joining papers, very effectually keeps these destructive pests at a distance — *Royle Beng Phar* p 322

**COPPER-WARE** and tutenague utensils, with coral and glass beads, all form a small portion of the Chinese trade to India, the Chinese seldom use glass beads as ornaments.

**COPPERAS**, syn of blue vitriol, cyprian vitriol, roman vitriol, sulphate of copper. See Blue stone. Copper, sulphate of

COPSYCHUS, a genus of birds of the order Insectivores, Fam. Merulidae, and Sub family Saxicolinae

COPSYCHUS SAULARIS The Dial bird, it is common in Ceylon

COPT, a race in Egypt, about 150,000 souls, following christianity. Though more or less mixed with other races, they are the undoubted descendants of the ancient Egyptians. The Coptic language became almost extinct as a living tongue in A.D. 1700. They now for the most part speak Arabic. It was found, when the hieroglyphic letters were written in English letters, that the words formed were in the main Coptic, with a slight admixture from the Hebrew and other tongues, and that the language of the ancient Pharaohs did not differ so much from the language of their modern descendants, as modern English does from that of Alfred the Great. With this key, learned men, who knew Coptic, have been able to read the hieroglyphics. They have now an alphabet, grammar and dictionary, and any person may learn to read the mysterious language on the monuments of Egypt as easily as Greek or Latin. The language, though in the main Semitic, has a considerable mixture of Aryan, or Indo Germanic roots. The Turks call them, in derision, the posterity of Pharaoh, but their uncouth figure, their stupidity, ignorance, and wretchedness, do little credit to the sovereigns of ancient Egypt. Of the diminution of the numbers of the Copts, some idea may be formed from the reduction of the number of their bishops. They were seventy in number at the period of the Arabian conquest. They are now only twelve, and most of these are settled in Upper Egypt — *Bunsen's Egypt Cal Rev No 73 Sept 1861*, p 118 *Niebuhr's Travels*, p 104

COPTIS Its warriors, from their fortresses in the Thebaid, held the wealthy traders and husbandmen of the delta in subjection as vassals — *Sharpe's History of Egypt Vol 1* p 133

COPTIS TEETA. WALL

Mishmee Teeta ASSAM | Hong-lane CHIN

The "Golden thread root" of Assam, is a native of the mountainous regions bordering on upper Assam, and its root is in high repute

among the Mishmee, Lamas, and Assamese quantities are sent down to Assam in neat little baskets with open meshes, made of narrow strips of rattan, and measuring 3 to 4 inches in length by 2½ in breadth, and 1½ in width, each basket contains about an ounce of small pieces of the root from 1 to 3 inches long. The taste is intensely and purely bitter, very lasting, with only a slight aroma. On mastication the root tinges the saliva yellow. In North America, the *Coptis trifolia* is much employed as a bitter tonic. *Coptis teeta* root brings a very high price, and is deemed a tonic remedy of the greatest value. Its influence in restoring appetite, and increasing the digestive powers, are very remarkable. It did not seem to exercise any febrifuge virtue, but under its influence several patients recovered from acute diseases manifestly, and very rapidly improved in strength. The dose was 5 to 10 grs of the powder, or an ounce of the infusion three only. Lately, medical officers have used it as a substitute for quinine, both in remittent fever and in common agues. The tincture is a bitter tonic, and its flavour and colour are much more agreeable than the tincture of *Colomba* — *Beng Phar* p 422 *O'Shaughnessy*, pages 162, 163

COQUE DE LEVANT Fr Coccus indiens.

COQUILLA NUTS are produced in South America, in the Brazils, by *Attalea funifera*, according to Martins, or the *Cocos lapidea* of Gartner, the latter title is highly descriptive. The plant might advantageously be introduced into Southern Asia. The Coquilla nut shell is nearly solid with two separate cavities, each containing a hard, flattened, greasy kernel, generally of a disagreeable flavour. The cells occasionally enclose a grub or chrysalis, which consumes the fruit. The passages leading into the chambers are lined with filaments or bristles, and this end of the shell terminates exteriorly in a covering of these bristles, which conceal the passages. This end is consequently almost useless, but the opposite is entirely solid and terminates in the pointed attachment of the stalk. Sometimes the shell contains three kernels, less frequently but one only, and a coquilla nut has been seen entirely solid. The substance of the shell is brittle, hard, close, and of a hazel brown, sometimes marked and dotted, but generally uniform. Under the action of sharp turning tools it is very agreeable to turn, more so than the cocoa nut shell, it may be eccentric turned, cut into excellent screws, and it admits of an admirable polish and of being lacquered. On the whole it is a very useful material and suitable for a great variety of small ornamental works both turned and filed. See

man remarks that coquilla nuts being excessively hard, beautifully mottled with dark and light brown, capable of taking a very high polish, they are extensively used for turnery work especially in making the handles of bell-pulls, small tops, the knobs of walking sticks, umbrellas, and other articles. In addition to the nuts, a coarse black fibre is obtained from the oiled base of the petioles. It is collected by the natives, and partly used for consumption, partly exported to Europe, tied up in bundles of several feet in length, and sold in London under this name at about £14 the ton. It is manufactured into cordage in its native countries, and as it is light, cables made of it do not sink in the water. In 1850 about 250,000 nuts were imported into England and sold at 30-10s the 1000.—*Seymour Holtrapfel Poole's Stat of Com* p 98

CORACLE The ferries of rivers in India and the S of Asia are crossed in various ways, but on the Tigris, Euphrates, the upper Indus and its affluents, the practice of three thousand years still continues. Xenophon's ten thousand were ferried over on inflated skins, and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode, which still continues on the rivers named. Canoes are of common use on the ferries, two pieces of the bole of a palmyra tree, scooped out and blocked with clay at the end, and fastened together, are used in the Oneas. The wicker and leather coracle traverses most of the rivers in the peninsula of India. The ferrymen on the Kistnah river in the peninsula, are the Koli race, stalwart men. The Kih Katr or Madakpore race are also Kabi gira or ferrymen. See Boat

CORACOPSIS A genus of birds of the order Scansores or Chimbers, and Sub family Psittacine

CORALL, also written Cora, the mercantile name of plain silk cloth undyed. Bandanna is the same article dyed. This word is derived from hindina, to tie, because in dyeing the materials, the portions to be left white are tied into knots. See Cora

Corale	IT		

Coral, as seen in the market, is the calcareous shell of an insect, whose flesh has been removed. It is merely carbonate of lime secreted by species of polypi, its particles cemented together by a gelatinous secretion from these animals. Ovid thought it was soft and pliable in the sea, and only became hard when exposed to the air. Marsili, an Italian naturalist, thought coral to be a marine plant, and the polype animal its flower, and Dr Parsons entertained similar views, hence their name zoophytes, or plant animals. The

polypi that make coral are chiefly *Antipathes glaberrima*, *Madrepora earymbosa*, *M. pocillifera*, *Gorgonia tuberculata*, two species of *Astrea*, *Leopathes glaberrima* and *L. Lamarckii*. When still alive in the sea, the rough surface is seen dotted with red spots which are the polypi or coral insects, and a minute examination detects thousands of them, each inhabiting permanently a little cell of its own. Many of the polypi or coral insects have a little parasol shaped cover for the head, the arms are furnished with eight claws, very long compared with the body, and are generally seen extended as if searching for food. Some of the kinds of coral resemble gigantic plants with flowers and leaves. Some grow like a tree with leafless branches, and others spread out fan-like, into broad flat surfaces. The walls formed by polypi are always perpendicular. The brain coral is called *Meandrina*.

Coral is found in great abundance in the Red Sea, the Persian and Arabian Gulfs in various parts of the Mediterranean, at the Mauritius, on the coast of Sumatra, in Japan, &c. It is brought to China from all the islands of the Indian Archipelago in native vessels, and is there wrought into ornaments and official knobs or buttons. It sells from 40 to 60 dollars per pound according to the color, density, and size of the fragments. In former years, considerable quantities were imported in E. I. Company's ships from the Mediterranean, via England, but none for years past. It is imported to some extent into India, where the black coloured is most esteemed, next the red coral, *Corallium rubrum* of Lamarck. In Britain the pale pink corals are most prized. Liverpool received from Italy 120 lbs in 1852, and 146 lbs in 1854.

Several of the hill tribes of India are very partial to ornaments made of coral and amber. Tavernier tells us that in his time, the Japanese were very partial to coral, and he concludes his discourse on coral by telling us that "the meaner sort of people use it for bracelets and necklaces all over Asia, especially toward the northern territories of the great Mogul, and all along the mountains as you go to the kingdom of Asen and Bootan." In Europe, coral was believed to be a great antidote to the evil eye, and to ward off all dangers and injuries by sea and land. At the Mauritius, Honolulu, and islands in the Pacific Ocean coral rock is used as a building material, and in the Archipelago is burned into lime.—*McCulloch's Dictionary of Commerce and the Materia Indica* Faulkner C. W. King's *Precious Stones, Gems and Precious Metals* Lond 1865 *Belcher Voyages of the*

*Samarang Tarernier's Travels*, p. 151-152

**CORAL ISLANDS** Darwin describes them as of three forms, the Atoll, or Fairy ring of the Ocean, with a lagoon in the centre, barrier-reefs stretching along a vast extent of coast, and coral reefs which are merely fringes of coral along the margin of a shore. Von Buch is of opinion that the coral ring of the atoll is merely the edge of a submarine volcano, on which the coral insects have built. An atoll differs from an encircling barrier reef only in the absence of land within its central expanse, and a barrier reef differs from a fringing reef in being placed at a much greater distance from the land with reference to the probable inclination of its submarine foundation, and in the presence of a deep water lagoon-like space or moat within the reef. Atolls sometimes constitute a great circular chain enclosing a deep basin, but opening by one or more deep breaches into the sea. Sometimes they surround a little island by a girdle of reefs or form the immediate edging or border of an island or continent. Atolls occur in the Pacific in the Chinese seas, amongst the Marianne and Philippine Islands, Maldives and Laccadives, and there are, also, in the Eastern Archipelago, the atolls of the Sunda group, and in the Pacific ocean, are many of the coral islands.

The researches of Darwin have shewn us that the coral polype does not build from the fathomless depths of sea which immediately surround these reefs and islands. He seems to imply indeed that the coral animals cannot exist at a greater depth than thirty fathoms, but, whatever may be the case in tropical seas, living corals exist and build compound polypidoms at far greater depths in the northern latitudes. Darwin maintains that the whole area of the Pacific is slowly sinking, that all the reefs and islands are the summit of former mountains that all the coral structures were originally attached to the land at a shallow depth, and that to whatever depth below they now extend, it is only in a dead condition, and has been effected by the subsidence of the supporting land carrying the coral with it, while the successive generations of the living polypi, ever working upwards on the old dead foundation, have maintained a living coral structure near the surface, and that nearly in the same outline, and from the original foundation.

In coasting along a tropical reef, the extreme clearness of the water permits to be distinctly seen the coral shrubs and groves which rise from the blue transparent depths. They take various forms, some massive with meandering channels over the rounded surface, some forming honey-

comb blocks formed by the union of thin plates at various angles, many growing like trees or shrubs with leafless branches, more or less ramified, and with the twigs more or less slender and pointed, or thick and rounded. Under water, the whole surface is covered with a layer of jelly-like flesh, of many brilliant colours, formed by the crowding together of the myriad tiny polypi, which protrude their slender tentacles and expanding disks from the individual cells. Even when severed, the branches are exquisitely beautiful, so long as they retain the faint purple halo that plays around their ivory tips, but which soon vanishes. A rude touch beneath the water will cause the lovely tints—brilliant crimson, orange and emerald polypi,—to disappear, but they soon protrude again, and expand in their original loveliness. The dimensions attained by the labours of the minute workmen, is the most astonishing part of the spectacle. Some individual specimens of porites, in the rock of the inner reef of Tongatabu, are twenty-five feet in diameter, and *Astreas* and *Meandrinis*, both there and in the Feejee islands, measure twelve or fifteen feet. The platform resembles a Cyclopean pavement except that the cementing material between the huge masses is more solid than any work of art could be. (*Gosse's Natural History*, p. 92 *Darwin's Naturalist's Voyage*, Ch. XX.)

Sometimes the barrier reef recedes from the shore, and forms wide channels or inland seas, where ships find ample room and depth of water, exposed however, to the danger of hidden reefs. The reef on the north-east coast of New Holland and New Caledonia extends four hundred miles, at a distance varying from thirty to sixty miles from the shore, and having as many fathoms of depth in the channel. West of the large Feejee Islands, the channel is in some parts twenty-five miles wide, and twelve to forty fathoms in depth. The sloop of war *Peacock* sailed along the west coast of both Viti Lebu, and Vinn Lebu, within the inner reefs, a distance exceeding two hundred miles. "A barrier reef, enclosing a lagoon, is the general formation of the coral islands, though there are some of small size in which the lagoon is wanting. These are found in all stages of development: in some the reef is narrow and broken, forming a succession of narrow islets with openings into the lagoon, in others there only remains a depression of surface in the centre, to indicate where the lagoon originally was. The most beautiful are those where the lagoon is completely inclosed, and rests within a quiet lake. Makaki, one of the Kingmill group, is one of the prettiest coral islands of the Pacific. The line of vegetation is unbroken,

and, seen from the mast-head, it lies like a greenland thrown upon the waters. It is in the south Pacific Ocean that coral reefs and coral islands are seen in the greatest perfection. The largest known coral reef is the Great Barrier Reef that runs for 1000 miles parallel to the coast of Australia, and at a distance from the shore of from 20 to 60 miles. The Barrier Reef of New Caledonia is 40 miles long. The Maldive Archipelago, in the Indian Ocean, is 470 miles long and averaging 50 miles in breadth. It consists of a very large number of coral islands and islets, the largest of which is 88 miles in length by about 20 miles in breadth. The Chagos group of islands, many of which are submerged, extends over an area of 170 miles long by 80 miles broad. Coral reef is the popular name given to all kinds of coral buildings, but naturalists classify them into (a) lagoon islands, or atolls, (b) barrier or encircling reefs, and (c) fringing or shore reefs. The lagoon islands or atolls have met with the largest share of attention, not from their size or importance, but on account of their surprising beauty. Darwin beautifully describes the atoll, as "a vast ring of snow-white coral, often many miles in diameter, holding within it a low verdant island, in the centre of which is a calm, still expanse of water, a kind of lagoon, which, from reflection, is of a bright but pale green colour. In this lagoon one sees, here and there, a firm spot of land just a little elevated above the level of the water, on which there grows luxuriantly, the palm and the coco-nut tree, while on the outside of the ring, the great and foamy billows of the Pacific Ocean lash, with unrelenting fury, the dazzlingly white shores of the coral island. Barrier reefs encircle groups of small monotonous islands, and are often of immense extent. Sometimes the reef is visibly connected with the land that it surrounds, but more generally a long line of foaming and dashing breakers marks the separation between the open sea and the smooth waters of the channel beyond. Fringing reefs are of comparatively small extent, and only differ from the barrier reefs in having no separating channel between them and the shore. The Maldives, Chagos, and Laccadives are all of madreporic origin. The eastern coast of Australia, between 9° and 25° S. L., has a coral reef or barrier. The Great Barrier, an archipelago of coral islands on the north side of the Straits of Sunda, is remarkable. A similar group of islands is found between the Straits of Macassar and Bali. Marginal reefs extend from the island of Timor, along the southern coast of Sumatra, up to the Nicobars. The gaudiest fish live among the coral reefs, the

species of the Chetodon, the Balistinae, and Glyphosodon. A Pomacentrus is of the richest azure blue, the Glyptododon, and Theropon are striped and banded — *Louis Fisher's Ocean World*, London 1868. *The Structure and Distribution of Coral Reefs*, by C. Darwin, p 146. *Macgillivray's Voyage*, Vol I p 73. *Murray's Physical Geography*, p 80. *Gosse's Natural History*, pp 90-94. *Hartwig Jansen's Collingwood*. See Coral Polype.

**CORALLINACEÆ** A family of marine plants, belonging to the order Algæ. According to Harvey's definition it includes the Corallinae and Spongiteæ of Kützting, and the Corallinidæ and Nallipoidæ of Dr Johnston — *Eng Cyc*, page 143.

**CORALLINÆ** See Corallinaceæ.

**CORALLINE CRAB** See Cancer.

Crustaceæ.

**CORALLINIDÆ** See Corallinaceæ.

**CORALLIUM** Lat Coral.

**CORAL PLANT** Eng *Jatropha multifida*.

**CORAL TREE** *Erythrina Indica*. The *Erythrina* is a genus of tropical trees, with clusters of very large long flowers, which are usually of the brightest-red, whence their name of Coral Trees. Moore, when describing the Indian islands, notices the

"Gay, sparkling loories, such as gleam between  
The crimson flowers of the Coral-tree,  
In the warm isles of India's sunny sea."

Frequently their stems are defended by stiff prickles. Voigt notices 11 species of them known in India, of which are *E. arborescens* of Nepaul, *E. ovalifolia* of Bengal, *E. Indica* of India generally, *E. stricta* and *E. suberosa* of the western coast of India and *E. sublobata* of the peninsula — *Voigt* 237.

**CORALU** Tril Millet.

**CORAWA** A migratory race in the peninsula of India, engaged in mat making, basket making. There are several sections, the Tiling Corawa and Koonchi Corawa &c. An ancient writer on Cochin speaks of its lower ranks consisting of 1st, the Cannianol, who are astrologers, 2nd, the Corwaa, or exorcisers of evil spirits, 3rd, the Cuca Corwaa, snake charmers and diviners, and 4th, the Poenen Poeloon, who accompany them with tambourines or small drums. These four castes are in some measure distinct, but resemble each other in their strict separation from other castes, in their unsettled mode of life, wandering from place to place and earning their livelihood by exorcism, jugglery, snake charming, &c, like the heatbens in Europe and in their independence, for they manage their own law suits, punish their own criminals, and are subject to no prince or rajah. Another caste are the Moequaa, who inhabit the seashores and subsist by fish-

ing, many of whom have become Romish Christians. See India; Korawa.

**CORYATE**, Tom, described by Pennant as a most singular traveller of Britain. After publishing, in 1611, his most laughable travels styled *Coryate's Crudities*, prefaced by above forty copies of verses, by the waggish wits of the time (amongst which is one in the ancient British language) he set out on his greater travels and seems to have been buried at the port of Swally near Smat — *Pennant's Hindoostan*, Vol I p 73.

**CORCHO** Sp Cork.

**CORCHORUS** A genus of plants belonging to the order Tiliaceæ or Linden Tube, several species are known to occur in India, viz

<i>C. acutangulus</i>	<i>C. olitorius</i>
<i>C. capsularis</i>	<i>C. prostratus</i>
<i>C. fascicularis</i>	<i>C. trilocularis</i>
<i>C. humilis</i>	

**CORCHORUS ACUTANGULUS**, W and A.

*C. fuscus*, Roxb n 512 | *Tita pat* BENG.

This annual grows in Bengal and both peninsulas. Its flowers are small, yellow, springing up about Rangoon in the rainy season, and mostly found growing along with *Urena*, but not to the same extent. It affords a strong fine grey fibre — *McClelland*, *Voigt*.

**CORCHORUS CAPSULARIS**, LINN.

*Ghinnhita pat* BENG | Heart leaved corchorus Eng.

Cultivated in India and China is a fibrous plant like *C. olitorius*, Roxb n 581 — *Voigt*. See Jute Dhunchee.

**CORCHORUS DECEM-ANGULARIS**.

Roxb syn of *Corchorus olitorius*, Linn.

**CORCHORUS FASCICULARIS** ROXB n 582.

*Janghi-pat* BENG | *Bil nahita* BENG.  
Grows in Hindustan, Bengal and the Peninsula — *Voigt*.

Phetwun	BURM	Putta	SANS
Oimoa	CHIN	Perinta	TLL
Jew's mallow	ENG	Perintakura	"

An annual plant common in Bengal. There are two varieties, the green (*Pat*, *Beng*), the reddish, (*Bun-pat*, *Beng*), both are used for their fibres, which are called jute and pat, the Jute of commerce. A coarse kind of cloth (tit) is woven from the jute, and affords the materials of the well known gunny bags. An infusion of the leaf is much employed as a fever drink among the natives of the Lower Provinces. Grows wild about Rangoon during the rainy season, and probably also in other districts, though not to the extent that *Urena* does. It might be cultivated to any extent. The leaves

of this plant are used in Egypt as a pot-herb, and under the name of Nurcha or Sag greens, they are in common use amongst the natives of India. Both *C. capsularis* and *C. olitorius* afford the well-known Jute of commerce. They are largely cultivated, and both in the raw and manufactured form jute is exported from India. The plant is to be found every where under cultivation. Every farmer requires rope and twine and so grows a little jute. The fibre is extracted as in the case of the 'sunu' hemp. In the bazaar jute sells at 10 lbs per shilling, and the rope at from 5 to 7 lbs weight for do.—*Roeb. n. 582, Voigt Jaffrey, Royle, McClelland, O'Shaughnessy, p. 229. See Jute*

1856— 7	75,463,472	33,689	275,057
1857— 8	88,347,616	39,441	303,292
1858— 9			
1859— 60	84,254,512	39,060	290,018
1860— 1	122,325,280	53,716	409,371

In 11 years, the amount exported doubled, and the value more than doubled — *Selec Records Government of India Foreign Dept No IX p 25 McCulloch's Commercial Dictionary p 401 Dis Mason, Stewart, Royle M.E J Rep* See Bast Jute, Rhee, Sunn

**CORDIA** A genus of plants belonging to the natural order Cordiaceæ. In the southern part of the Peninsula, the Tamil name, Narvilli maram, seems to be applied indiscriminately to three or four species, viz, *C. Rothii*, *C. obliqua* and *C. fulvosa*, so that it is impossible to say which is the one meant by it. Dr Wight believes that the wood of all is very inferior, the trees being usually small. The following species are known

<i>C. angustifolia</i>	<i>C. monoica</i>	<i>C. rothii</i>
<i>C. cuneata</i>	<i>C. myxa</i>	<i>C. sebestena</i>
<i>C. domestica</i>	<i>C. obliqua</i>	<i>C. serrata</i>
<i>C. fulvosa</i>	<i>C. orientalis</i>	<i>C. tectonæfolia</i>
<i>C. gerasanthus</i>	<i>C. perrotetii</i>	<i>C. tomentosa</i>
<i>C. grandis</i>	<i>C. polygama</i>	<i>C. trichostemon</i>
<i>C. latifolia</i>	<i>C. prionodes</i>	<i>C. Wallichii</i>
<i>C. leschenaultii</i>		

*Cordia angustifolia* extends from the Peninsula up to the banks of the Ganges

*Cordia latifolia* and *Cordia tomentosa* are confined to the southern parts. In the Dehra and Kheree jungles, *Cordia lator* is found, *Ham Buch* perhaps only a variety of *Cordia myxa* with a new species *C. incana* — *Royle Voigt 411 W Ic. M E J Rep Royle III Him Bot p 306*

### CORDIA ANGUSTIFOLIA, ROXB

*Cordia reticulata, Roxb*

Narrow-leaved Sepis-	Liv ar	SIND
tan	Eng	Narvalli
Gund	IND	Chinnabotukun
Gundm	"	Nukkeru

This tree grows in Hindwar, Guzerat and the Dekhan, is from 30 to 40 feet high, the wood is very tough, and is used for carriage poles, posts, and in house building. It is common about villages in the Circars, but never seen in the jungles. Fruit the size of a large pea, round and smooth, the pulp yellow, and gelatinous edible but tasteless, the tree is common throughout the Decan. It is possible that the bark of some of the species of *Cordia*, when young, may yield a useful fibre — *Royle, Fib Pl page 11, Dr Riddell, Captain Beddome Voigt Birdwood*

**CORDIA DOMESTICA** ROXB Syn of *Cordia myxa*, Linn

### CORDIA LATIFOLIA, ROXB

Sepistan	AR PERS	Bhokur	HIND

Broad leaved Sepis-	"	Gedooroo	SINDH
tan or Cordia	ENG	Sheloo	SANS
Burgoond, Vungoond Guz		Kichvungi chettu	TEL

The tree is common in Guzerat, Hindostan, but mostly confined to the southern parts of India. It has numerous spreading branches, and the young shoots are angular and smooth. The general height of trees, ten or twelve years old, about 20 feet. The fruit is eaten "phaleet" or slow matches are made of the bark. The tree is hardy and ornamental, and would do well in compounds along with other trees. The wood is very inferior, and of small size. Under the name of sebesten plums, sebestans, or sepistans, two sorts of Indian fruit have been employed as pectoral medicines, for which their mucilaginous qualities, combined with some astringency, have recommended them. They are believed to have been the Persea of Dioscorides. This tree furnishes one of them. Linnæus applied the name of *Sebestan* to an American species of this genus which is not known in medicine — *Eng Cyc p 146, Dis Roxb Voigt Irvine O'Shaughnessy Wight and Royle Mr Elliot in Fl Andh*

### CORDIA MACLEODII ? (qu monoica ?)

*Hemigymma Macleodii* Dhengun HIND ?

Kendal	JAV	Mookooloo karra	„

A native of Egypt, Persia, Arabia, of Ceylon, Hindostan, Nepaul, and the forests of the Godavery. It grows wild in the Siwalik up to 4000 feet. It is common throughout the Konkan, Pegu and the Malay Peninsula. There are two varieties. The trunk is from 8 to 12 or 15 feet high, generally crooked, but as thick or thicker than a man's body, with numerous spreading branches bent in every possible direction, and forming a dense shady head with a grey cracked bark. The wood is soft, and of little use except for fuel. The wood in Kangra is said to be white and soft, and is mostly used for fuel. In Sind, also, fuse is prepared from the bark of this tree. In the Circars, ploughs are said to be made from its wood. In British Burmah, its soft wood is not used. A cubic foot weighs lbs 33. In a full grown tree on good soil, the average length of the trunk to the first branch is 15 feet, and average girth measured at 6 feet from the ground is 4 feet. The leaves are collected extensively and sold for cover leaves for cigars. It is reckoned one of the best kinds of wood for kindling fire by friction and is thought to have furnished the wood from which the Egyptians constructed their mummy cases. The wood and bark are said by Dr Royle to be accounted a mild tonic. Its fruit is the smaller sebastans or lobestens of European medicine, it is a yellow berry with a strong sweetish taste, and serves as a preserve, the mucilage of the fruit, called "Gondi" is demulcent. The root is said to be purgative. The larger fruit is called lasura, and the smaller variety lasuni, its seed are the Chakoon ki binj, Hind, used in powder mixed with oil as an application in ringworm — *Dis O'Shaughnessy, p 498, Stewart, Royle, Brandis Riddell Powell Eng Cyclop Flor Andh Voigt Dr. Burdwood Thw En Pl Zeyl, p 213*

CORDIA OBLIQUA WILLD

A small tree, rare in the Siwalik tract, nearly as far as the Jelum and in the Salt Range to 3,000 feet. Common in the N W Provinces. The wood is valued for wheel work. The fruit is eaten, and said to be sweet — *Dr J L Stewart*

COREZOLO IT Black lead

CORDUFA NICA See Mirafra

COREA This peninsula is tributary to China, though it is ruled by a Corean king who nominates his successor subject to the confirmation of the emperor of China. Corea is bounded on the north by Manchuria, west by the Yellow Sea, N. W by the province of Lyntong, by the Straits of Corea on the south, and Sea of Japan on the East. It is mountainous and very cold in winter. It

is carefully cultivated, and produces large crops of rice, wheat, and esculent roots. Cotton is grown largely in the southern provinces, flax is also cultivated, and small quantities of silk are exported to China. Corea, or Korea, is called Chaoi Seen by the natives, the Chinese call it Kaoh. The higher classes have a tendency to the Turanian physical type as with the Japanese and those of Siberia — *Yule Cathay, II* p 268

**COREOPSIS** Agents of flowering plants, well worth cultivating in India either in pots or the flower garden. Raised from seeds, should be sown at various times during the cold months, for the purpose of obtaining a succession of bloom. Sown in February, they may be had in flower during the hot months, if attended to with water, at which season my flower is acceptable. There are several varieties of *C. tinctoria*, a deep orange yellow, striped with red. The name is derived from the resemblance of its seeds to an insect. — *Mason*

**COREYGAON** A battle was fought here on the 1st January 1818, in which a small detachment of Madras artillery and infantry successfully repulsed repeated attacks on their position in that village from about 4000 of the elite of the Peshwa's army. The village is on the right bank of the Bhuma, about 30 miles north of Poonah.

**CORGE** Twenty pieces of cloth

		Kotumiri	TIB

The fruit or seed of the annual plant *Coriandrum sativum* cultivated in the East and in Europe, and procurable in all Indian bazars. When fresh, their smell is strong and disagreeable, but by drying it becomes sufficiently grateful. They are used as an ingredient in curries in India, and medicinally as a stimulant and stomachic. In Europe, coriander seed is chiefly used by distillers to produce an aromatic oil. The quantity imported annually into Britain does not exceed 50 tons, and it is brought principally to the port of Hull. At the Madras Exhibition of 1855, coriander, aniseed and cummin were largely exhibited from several collectorates. The seed sells at 24s the cwt — *M E J R Simmonds McCulloch Budwood Waring*

The coriander plant is found in the cornfields of Turkey, the Levant, Greece, Italy, and south of Europe, and it is grown in every part of Southern Asia, where the leaves are used by the natives for chutnies and curries, the fruit being also comminative and aromatic, are used in decoction, in sweetmeats, in certain stamachic liqueurs, and in some countries in cookery. They are little esteemed in England. During the unripe state, the odour resembles that of hags, but this changes rapidly as ripening proceeds, and Fee derives *coriandrum* from *xopis* a bag — *O Shaughnessy* page 371 *Rorb* n 94 *Port* 23 *Lindley* See Vegetables of Southern India. Cork is the outer bark of *Quercus suber*, an evergreen oak abundant in Portugal, Italy, the south of France, Corsica, and in Spain, throughout the whole extent of the Tierra Caliente, but most abundant in Catalonia and Valencia, whence the principal exports have been made. This substance is developed on other plants, but on none in so large quantity as in the *Quercus suber*. It is light, porous, compressible, and elastic, and floats for nets and other articles: it is cut and shaped out of it. As soon as the bark dies, it falls off in flakes which correspond to the layers that are formed annually. These outer layers the Spaniards collect, the inner living bark should be spared, but the Spaniards strip off the inner bark also, although of no value except for tanning, and its removal destroys the trees. In Corsica, Spain, and a few other countries, where the tree is abundant, the bark is removed for tanning. This bark contains twice as much tannin as oak bark of average quality. The tannin appears to resemble that of catechu: it affords scarcely any bloom, and gives a dark colour to the leather. At the Madrid Exhibition of 1855, two specimens of cork were exhibited: one good, from the 'Western Coast Jungles,' and another inferior, from Combario, the trees producing the samples were not mentioned. The deeply cracked spongy bark of the "*Bignonia suberosa*", the country-cork tree, yields an inferior kind of cork.—*M E J R Eng Cyc* p 148 *McCulloch Dict of Commerce*

CORMUS See Colchicum.

CORMORANT, Salach HFB Cormorants are trained in great numbers in the eastern Chinese provinces to capture fish, and are sometimes under such good order that they will dispense at a given signal, and return with their prey without the precaution of a neck ring. A single boatman can easily oversee twelve or fifteen of these birds, and although hundreds may be out upon the water, each one knows its own master. If one seize a fish too heavy for it alone, another comes to his assistance, and the two carry it aboard. The birds themselves are fed on bean curd, and eels or fish. They lay eggs when three years old which are often hatched under barn-yard hens, and the chickens fed with eel's blood and hash. They do not fish during the summer months. The price of a pair varies from \$ 5 to \$ 8. See Fisheries.

A quartzose mineral, found in great abundance in India, classed as one of the inferior gems and largely cut at Cambay, collected from the drift of the Raj Peepla range. Shafts are sunk, to the stratum containing the minerals. These are burnt to bring out the colours and are cut into paper weights, knife handles, miniature-sized cups and saucers, tables for snuff-boxes, sets of brooches, necklaces, and bracelets, pins, buttons, and studs. A field gun, with all its appointments, is one of the finest ornamental pieces of Cambay stone work, they sell for from Rs 40 to Rs 50. The polish of Cambay stones is not such as pleases the eye of the English lapidary—yet they are so cheap they might be expected to become a considerable article of commerce, and might be built up into mosaics for work tables, into chess-boards and other elegant articles of furniture—the chief part of the work being performed here, where labour is cheap, the final finish being given in Europe. The Cambay agates equal the finest "Scottish Pebbles" in beauty, they generally exceed them in size, and may be had for a mere fraction of the price.

**CORNWALLIS**, Earl, a great statesman and soldier, who was twice Governor General of India. He had served successfully in Ireland, but in America with great disasters. He was sent out by Mr Pitt to India when the Act of Parliament of 1784 and 1786 was passed to give him supreme power. He instituted great reforms in the habits of the E. I Company's servants, he was the first to bring about unity of action between the Indian and Home Government, and the first to recognize the duty of paying Indian servants well and to abolish all distinctions between the King's and Company's military servants. In 1788, he received power to bestow local commissions on the latter. His care was directed alike to financial and administrative measures, but also to the moral and social condition of the Anglo Indian community, and in 1793 he issued Regulations which have formed the basis of the administration of justice in India, and gave effect to the long discussed subject of perpetual settlement under a Zemindar class, a system which has been greatly condemned. He went from India to Ireland, and returned to India only to die

He died at Ghazipore on the 5th October 1805

**COROLLIFLORÆ**, Plants which have the corol composed of a single piece or petal, into which the stamens are inserted.—*Royle Him Pl p 302*

**COROMANDEL** On the eastern coast of the peninsula of India, is a small village near Pulicat on the maine lagoon of that name. Some suppose it gives its name to the entire eastern coast of the peninsula, generally called the Coromandel coast, this being the name by which Europeans distinguish the line of coast on the western side of the Bay of Bengal. It has been derived also from Chola-mandala, which Paolin, the Carmelite, explains to mean the middle country, but most scholars interpret it as the country of the Chola race, the Chola of Tanjore and Combaconum, who were settled near the Cavery and Coleroon rivers, and were one of three hindu dynasties, who anciently held the Tamil country in the South. It is not impossible, however that the general name has been given from this village of Kuri-mandlum or Coromandel, Tam "Black Sand," the village alluded to as on the sea bank of the Pulicat lake, about 35 miles north of Madras, and formerly held by the Dutch

**COROMANDEL WOOD**, is the produce of a Ceylon tree of great size having a dingy ground, and sometimes running into white streaks. The figure is between that of rosewood and zebra-wood, the colour of the ground is usually of a red hazel brown, described also as chocolate brown, with black stripes and marks. It is hard but the veneer saws cut it without particular difficulty. It is a very handsome furniture wood, and turns well. Mr Lyard says there are three varieties, the Calamander or Coromandel which is the darkest, and the most commonly seen in England, the Calamberri, which is lighter coloured and striped, and the omandei, the ground of which is as light as English yew, but of a redder cast, with a few slight veins and marks of darker tints. He says the wood is scarce and limited to Ceylon, that it grows between the clefts of rocks, this renders it difficult to extract the roots, which are the most beautiful part of the trees. It is also called calamander wood—both names being a corruption of two Singhalese words kalu-mederiye.—*Faulkner Mendis Thedgold Holtzappfel, Fergusson*

This plant is held in high estimation on account of the great beauty of its delicate purple flowers, the leaves are employed as poultices, mixed with a little castor oil, to hasten suppuration. The leaves smell like fresh clover, and are food for cattle. Nuteeya and Nilu leaf poultices are favourite external emollients among the native practitioners — *Ains Mat Med* page 75 *Beng Phar* page 390

## CORONUS See Koh

COROSOS or Ivory Nut, is produced by the *Phytalephas macrocarpa*, growing in central America and Columbia (*Humboldt*). The tree is a genus allied to the Pandanæ, or serew pines, and also to the palms. They are seeds with osseous albumen. The nuts are of irregular shapes, from one to two inches diameter, and when enclosed in their thin husks, they resemble small potatoes covered with light brown earth. The coat of the nut itself is of a darker brown with a few loose filaments folded upon it. The internal substance of the ivory-nut resembles white wax rather than ivory, it has, when dried, a faint and somewhat transparent tint between yellow and blue, but when opened it is often almost grey from the quantity of moisture it contains, and in losing which it contracts considerably. Each nut has a hole, which leads into a small, central, angular cavity, this joined to the irregularity of the external form, limits the purposes to which they are applied, principally the knobs of walking sticks, and a few other small works. It might be introduced into India — *Holtzapfel*

CORPULENCE is a state of body very frequently seen amongst the richer of the natives of India, caused by the use of a large extent of fatty articles of diet. A tabular statement, taken from a mean average of 2,648 healthy men, was formed and arranged for an Insurance Company by the late Dr John Hutchinson. It answered as a pretty good standard, and insurances were regulated upon it. His calculations were made upon the volume of air passing in and out of the lungs, and this was his guide as to how far the various organs of the body were in health, and the lungs in particular. It may be viewed as some sort of probable rule, yet only as an average, some in health weighing more by many pounds than others.

CORUND KA PATHAR HIND Corundum

## CORUNDUM.

Adamantine Spai	ENG	Karund	HIND
Samada	Guz		

Several substances differing considerably in colour, and sometimes in form but nearly agreeing in composition are classed together under the name of corundum, which is that given to the common variety by the natives of India. This stone is, with the exception of the diamond, the hardest substance known. It is generally of a pale gray or greenish colour, but sometimes of red and brown tints. It is found in India, China, and in some parts of Europe. The Indian variety is whiter

than the Chinese, and is considered the purest. In India, diamond dust is very rarely used, corundum being the chief material employed in polishing gems, marbles, and metals. This mineral is found chiefly in granite or the detritus of granite rocks in the Mysore country and in the neighbourhood of the south-western ghats. It is brought in considerable quantity to Bombay and is occasionally exported to Europe. It is packed in orange shaped parcels with meridional cordings. The pieces vary from the size of filberts to that of the hand, they are generally amorphous or fragments of crystals, often contaminated with felspar, mica and other granitic minerals. Sometimes fragments of crystals perfectly pure are to be met with weighing from ten to twenty-five pounds, but these are rare. Though excessively hard, it is by no means tough—it flies in pieces after a few strokes of the hammer, and is easily pulverized in a mortar. The natives generally beat it on an anvil of stone, keeping it from flying about by a collar of cotton rope. The fine particles are separated from the coarse by sifting—the European process of lixiviation is not, seemingly, resorted to. For sharpening swords or burnishing metals it is generally used like a whetstone or burnisher, for polishing gems, it is either made up into a cake with lac or into a paste with oil or grease. It is never employed for the manufacture of emery paper or anything resembling it. For polishing marble or other stone it is used in two forms, viz that of a cake of about eight inches long, three across and two deep. This is used by an individual in the hand. For heavier purposes a cake a foot square or so is employed placed in a frame. Two men work at this, and the redning process is very rapidly accomplished by it. It is in fact a file with a lac body and corundum teeth.

The corundums of the Madras Presidency are well known to the people, who use them in mass or mixed in lac, in the form of discs for laps, or wheel grindstones, they are used by cutlers, &c also in the form of whets and hones, and ragstones for sharpening the finer and coarser cutting implements used by farmers &c. The native workmen, cutlers, &c often do not distinguish garnets from corundums, calling both of these emery, though the differences between the three minerals are so marked, it is difficult to understand how they can be confounded. The corundums of Southern India seem to replace the emery of other countries, at least, I am aware of only one author who has alluded to the occurrence of emery in Southern India, and the Madras Museum does not contain any substance that

merchants would regard as identical with the Turkish or Grecian emery of commerce. The meaning or origin of the word is not very apparent—the mahomedans call it "corund" or "corun" stone, and the hindoos know it by a somewhat similar name. The first specimens sent to Europe were forwarded by the late Dr Anderson to Mr Berry, a lapidary in Edinburgh, as the substance used by the people of India to polish masses of stone, crystal and all other gems, except the diamond,—and it was then examined by the celebrated Dr Black, who, from its hardness, named it adamantine spin. Corundum and its varieties, viz Oriental Sapphire, Corundum and Emery, are only surpassed in hardness by the diamond. They belong to the same class of minerals, and the emery of commerce, which is so extensively used in Europe and imported into England for grinding and polishing metals, glass, &c, is supposed to be a mere variety of corundum, a mixed granular corundum, a mechanical mixture of corundum and oxide of iron, the iron in some of the varieties amounting to 33 per cent.

No	Localities	Chemical Composition							
		Effective Hardness	Specific Gravity	Water	Alumina	Oxide of Iron	Lime	Silica	Total
1	Kulsh	57	4.28	1.90	63.50	33.25	0.92	1.61	101.18
2	Samos	56	3.98	2.10	70.10	22.21	0.62	4.00	99.03

6	Naxos	46	3.75	4.72	68.53	24.10	0.86	3.10	101.31
7	Nicoria	16	3.74	3.10	75.12	13.06	0.72	6.88	98.88
8	Naxos	14	3.87	5.47	69.16	19.08	2.81	2.11	99.23
9	Gumuch	42	4.31	5.62	60.10	33.20	0.48	1.80	101.20
10	Kulsh	40	3.89	2.03	61.05	27.15	1.30	9.63	101.13

In the mixed corundums of Greece and Turkey, the iron seems equally diffused through the mass, imparting to it a bluish grey colour, but in the specimens which have reached the Madras Museum from Southern India, the corundum and ore of iron, though occurring together, are not mixed, but remain apart, segregated, the corundum forming one side of a mineral, and the oxide of iron, in a lump or lumps, on the other side, and all such masses are magnetic and possess polarity.

What prices the several corundums of India might bring in the London market it is difficult to say. There is no reason why the picked corundums should sell for less than

the finest emeries, and Captain Newbold mentions that the corundums near Gram, when sorted into the three sorts known in commerce, viz the *red*, the *white*, and the *gray*, of these two are sold to the Arab merchants at Mangalore and Tellicherry at prices from twelve to fifteen or thirty rupees the candy, equal to £1, £6, and £12 a ton. Corundum occurs in abundance in several parts of the peninsula of India, in North Arcot, Cutch, Coimbatore, Guntoor, Mysore, Salem and Hyderabad.

It is also said to be found at Mundum in Mysore, at Gudpellutty in Coimbatore, at the Tipoor Ghut in Salem, at Chemmully in Coimbatore and in Cutch. At Nannul and at Viralmodos, on the north bank of the Convery, in the Perimutty talook, Salem district, it occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. It is found in great abundance in a low hill near the village of Sholasingam, Trichingode talook, Carnel, Apore, Mallipollicy, and at various localities up the river Convery, as far as Coecorambodi, where it is dug for by the natives in the fields, and there are remains of many ancient excavations still to be traced. The corundum was formerly sent in an article of traffic to Palghat, and thence to the western coast and various other parts of India. It can still be procured at the rate of from fifteen to thirty measures the rupee, each measure weighing fifty-seven ounces avoirdupois. The caste usually employed in collecting it is the Vitarai. At the Madras Exhibition of 1855, Mr Rhode exhibited specimens from Guntoor, and remarked of them that experienced jewellers would pick out stones suited for common jewellery from it, and the refuse cannot be worth less than £15 and £20 a ton at home. From Hyderabad was received a very excellent sample of picked stones, possessing an irregularly crystalline structure. Salem and the Mysore country, however, have been the longest known as containing corundum sites, some of which were described at some length by the late Captain Newbold, who mentions its occurrence in the neighbourhood of Gram, a village and fort in the Mysore country about ninety-eight miles westward from Bangalore, and lying between the latter place and the Western Ghats, about forty-five miles north by west from Seringapatam, and about seven or eight east by north from the fort of Gram. The following places may be named as sites in Mysore where corundum occurs —

Nannul Viralmodos — On the north bank of the Convery, in the Perimutty talook — Newbold

Sholasingam, (probably Scholasingam) —

chingode talook, near the village in a low hill in great abundance — Newbold

Gronel, Anpore, Mallapollye, and at various localities up the river Convery as far as Coecorambodi where it is dug by the natives in the fields, and there are remains of many ancient excavations still to be traced — Newbold

Professor Thomson mentions (Outlines of Mineralogy, volume 1, p 213) that "the corundum occurs in imbedded crystals in a rock which consists, according to Count Bourne, of indurite, and contains felspar fibrolite, several varieties of rutile, and also octohedral iron ore, the hair brown or reddish brown varieties are called adamantine spar. They occur with fibrolite and octohedral iron ore in a sort of granite containing no quartz." And again (p 256) he states, that fibrolite is a mineral found accompanying crystals of corundum in the Cinatic, and that it is a component part of the granite, which is the matrix of the corundum of China. Professor Jameson, in his Geognosy of Peninsular India (Ed. Cab. Lib. No VIII, pp 349-50) gives a summary of what is known regarding the corundum of Southern India, and states that it occurs embedded in granite and sienite in the district of Salem, in the Madras presidency, associated with cleavelandite, indurite, and fibrolite, but near Gram at Gollushully and Kulkani, at which the best corundum is said to be obtained, the mineral was found to occur in decomposed beds of a talcose slate, to which gneiss is subordinate, associated with nodules of undulated talc, and of a poor quartz iron ore, asbestos, chlorite, actinolite, and schist were found in the talcose slate. Newbold mentions that in the Salem district, also, this mineral occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. Rubies have from time to time been discovered in many of the corundum localities just enumerated, associated with this gem, particularly in the gneiss at Viralmodos and Sholasingam in the Trichingode talook and at Malla-

polys, though comparatively speaking rare. Passing, says Captain Newbold, last year through Giam, I was informed that corundum was found in its vicinity, at Golhushully, in the division of Noogyhully, at Kulkari, Burkunhully, Kundeo and Yedgunkul, in that of Chinrayapatam, at Norhik, in Narsipur, at Deysani, Curbonhully, in Bnawaram, and at Apyiahully in that of Harnhully. At Golhushully and Kulkari, the best corundum is said to be obtained. The formation around Giam is gneiss associated with protogine. Proceeding from it in a westerly direction, the northern shoulder of the insulated range, south of the village of Belladana, running nearly north and south, is crossed, and the soil suddenly changes from a light sandy colour to a deep red. The surface of this soil is covered with fragments of a ferro siliceous schist, with quartz in alternate layers. The natives have a tradition that gold was formerly got from this hill, which is not at all improbable, as it is found in similar gangue near Baitmungalum, sixty-one and a half miles east from Bangalore, and at Malliyalum, near the south-west border of Mysore in Coimbatore. Minute grains occur in the sandy bed of a brook there. A little farther west, where the talus of the mountain subsides into the plain, the gneiss reappears, alternating with talc slate in nearly vertical strata. The dip, as observed in an adjoining nullah between the mountain and the village of Belladana, is to the east by north, and the direction of the strata N 22° east. The corundum mines of Golhushully lie four or five miles north east of this place, and those of Kulkari about a mile farther. The surrounding country is a succession of smooth slightly convex plains except to the south east, where the gneiss rises above the soil in a rocky ridge, terminating in a knoll about 700 yards to the east by south of the mines to which it descends, rising again into a slope to west north-west of the mines, on which lie fragments of a light brown compact quartz iron ore. Nearly at the bottom of this slope are the mines, from which the ground descends on both sides, to the north-west to a tank, and towards the south east to the village of Golhushully, about a mile distant.

The chert, and a dark red ferruginous jasper are used by the natives as flints. Salt springs occur in the vicinity. The wells about Giam are both sweet and brackish within a short distance, and a fragment of rock salt was found in the green earth of the mine. A little to the east of Kulkari is a low plain nearly covered with a white travertine, partly compact, partly cellular, resembling that found in the bed of the Cavary at Seingapatam.

*Mines of Kulkari*—The corundum mines at Kulkari are situated both near the summit and at the foot of the excavations, of the rising around there. There are a series of excavations varying from two to twelve feet in depth, sunk perpendicularly through similar strata to those just described. The corundum is thrown out, cleared, and separated by the miners into four classes, viz, the red, the white, the scraps of both, and the refuse. The three first form the article of commerce, which is carried to Mangalore and Tellicherry, and sold to Bombay and Arab merchants at prices from twelve and fifteen to thirty rupees the candy, according to its quality. The contractor for corundum in Mysore took the mines for two years, for which he was to pay the sum of 530 Canteary pagodas. The former contractors paid 500 for two, or 250 for one year. The corundum is used by natives, pounded as emery, to polish precious and other stones, particularly granite and basalt. It is also mixed for this, and other purposes, with melted lac, in fine and coarse powders, as we use a mixture of glue and sand.

*Common Corundum*, or Adamantine spar, occurs, like the sapphire and ruby, commonly in the secondary form of 6-sided prisms, but usually much larger. It is sometimes nearly colourless, and rather translucent, it presents great variety grayish, occasionally brown or red, rarely blue. Although its most common form is the 6-sided prism, it occurs, though rarely, also in acute and obtuse double 6-sided pyramids.

*Corundum pebbles* are found in "the gem-sand of Ava river," and they probably exist in the sands of some of the rivers in the Tenasserim provinces.

*Prismatic corundum or chrysoberyl*, is found among the Toia hills near Rajmahal on the Bunas, in irregular rolled pieces, small and generally of a light green-colour, these stones are considered by the natives as emeralds, and pass under the name of "punna," but the natives are aware that they are softer than the real emerald of India which is generally green coloured sapphire.

*Sapphire*, of which there are several varieties, the names of which are dependent chiefly upon their colour. The White Sapphire, which is transparent or translucent, the Oriental Sapphire, which is blue, Oriental Amethyst, which is purple, the Oriental Topaz, yellow, the Oriental Emerald, green: some other varieties occur, as the Chatoyant and the Opalescent Sapphire.

*Ruby*—Colour blood-red or rose-red, sometimes a tinge of violet, generally, occurs

in 6-sided prisms It is not so hard as the sapphire, and is more readily cleaved Like the sapphire, it consists of pure alumina "The largest oriental ruby known was brought from China to prince Gagarin, governor of Siberia, it afterwards came into the possession of prince Menzikoff, and constitutes now a jewel in the imperial Crown of Russia"—*Dana Engl Cyc* page 151 *Report for 1856 on the Government Central Museum Madras, by Edward Balfour, Officer in Charge M E Jur Rep Dr Mason Captain Newbold, Irvine Gen Med Top of Ajmir p 150*

CORVIDÆ, a family of birds sub order Passeres, sub fam A Corvinæ, 1 gen 7 sp viz A Crows, *Corvus culminatus*, *corone*, *cornix*, *splendens*, *macrorhynchus*, *frugilegus* The genus *corvus* has no representative in all South America, nor in New Zealand, nor in the numerous archipelagos of the Pacific, and there is one species only in Australia Levaillant's raven of South Africa, described by him as identical with that of Europe, has been sought in vain by subsequent observers in that region *Corvus corax*, the raven, takes the circuit of the northern regions, rare in N Africa, Punjab, Kashmir, Afghanistan, a Tibetan species considered distinct, but probably on insufficient evidence The true raven is pre eminently a bird of the coldest climates though a few occur so far southward as in the Barbary States, in America so low as in the Carolinas, and in India proper within the Punjab only "The raven," remarks Sir John Ross, "is one of the few birds that are capable of braving the severity of an arctic winter" In the fearful cold of a northern Siberian winter, von Wrangell says that when "even the reindeer seeks the forests to protect himself from its intensity in the tundra, equivalent to the 'barren-grounds' of Arctic America, where there is no shelter to be found, the whole herd crowd together as closely as possible to gain a little warmth from each other, and may be seen standing in this way, quite motionless Only the dark bird of winter, the raven still cleaves the icy air with slow and heavy wing, leaving behind him a long line of thin vapour, marking the track of his solitary flight" The Tibetan raven is considered as a peculiar species by Mr Hodgson, an opinion to which the Prince of Canino seems to incline it may be presumed to inhabit the lofty mountains of Butan to the north, but the smaller crow of Southern Asia is the *C splendens*, while the common black crow of all India, *C culminatus*, would seem

to stand here alike for the 'raven,' the 'carrion crow' and the 'rook' The true rook, *Corvus frugilegus*, however, is known to inhabit or visit the Peshawur valley, Afghanistan and Kashmir The rook of China and Japan is considered a distinct species, *C pastinator* of Gould, and the jackdaw *C monedula*, accompanies it in those countries, while the true northern raven *Corvus corax*, is met with not only there, but also over a great portion of the Punjab In other parts of India the comparatively small *C culminatus* is popularly known to Europeans as "the raven" but the northern raven would make a meal of one and not feel much the worse for it See Birds, *Corvus*

CORVINUS, a genus of fishes, several species of which, *C bola*, *C chaptis* and *C coitor* furnish isinglass *Corvinus bola* *McClell*, *Bolo Chaptis*, *Buch*, furnishes the isinglass which Mr O'Riley sent to Calcutta from Amherst It is closely allied to *C niger*, but of monstrous dimensions compared with the European species This is the fish, the jawbone of which is described as "Boalee"—*Mason McClelland* See Fish

CORVUS ADVENA, a rare black and white crow of Celebes, occurs along with *Cittura cyanotes*, the forest king fisher of Celebes, *Meropogon Forsteni*, *Carpophaga Forsteni*, a fruit pigeon of North Celebes, *Buceros cassidix*, the great hornbill of Celebes *Trichoglossus ornatus*, a beautiful brush tongued paroquet

CORVUS CORONE, the Carrion Crow of Europe, Afghanistan, (Pushut) Japan apud Temminck, is replaced in India by *C culminatus*

CORVUS CORNIX ('Hooded Crow') Europe, Asia Minor, Afghanistan, Japan (Temminck), Barbary

CORVUS CULMINATUS See Corvidæ

CORVUS FRUGILEGUS 'Rook' Europe, N and W Asia, Afghanistan, Peshawur valley, Kashmir replaced in China and Japan by *C pastinator* The true rook (*Corvus frugilegus*) is known to inhabit or visit the Peshawur valley, Afghanistan, Kashmir (the rook of China and Japan being considered a distinct species, *C pastinator* of Gould,) and the jackdaw (*C monedula*) accompanies it in those countries, while the true northern raven is met with not only there, but also over a great portion of the Punjab In other parts of India the comparatively small *C culminatus* is popularly known to Europeans as "the raven" but the northern raven would make a meal of one and not feel much the worse for it See Birds

CORVUS MONEDULA, the 'Jackdaw' of Europe, Siberia, Barbary, W. Asia, Peshawur

wul valley, Kashmīr — *Cat Birds B. As. Soc Eng Cyc* See Birds

CORVUS PASTINATOR See Corvidæ.

CORYDALIS, a genus of plants belonging to the sub order Fumariæ, the funnitory tribe There are sixteen species some of which are grown as ornamental plants

CORYDALIS GOVANIANA, WALL, Bhootkes, *Hind*, is common above 8,000 feet of elevation, in the Choor mountains, where it is regarded as a charm against evil spirits The roots sent by Dr Falconer were long, fibrous, tough, and exceedingly bitter, dark brown externally, yellow within — *O'Shaughnessy*, p 185

CORYDALLA CAMPESTRIS A common European bird which even abounds in the southern parts of Sweden, but has not hitherto been observed in Britam, is also common in parts of India

CORYDALLA RICHARDI, (Antinus Richardi, 'Richard's Pipit') Europe, Asia, N Africa, common in India, very rare in Britam See Birds

CORYDON Captain Tickell found *Leiothrix argentauris* and *Siva stigmata*, about the sides of Moolait *Stachyris nigripes*, in hillv forests 3 000 feet *Eurylaimus Javanicus* is not common, at least it is not often seen, being very quiet and secluded though exceedingly tame, and not crepuscular like *Corydon* *Sceloporus lineatus* are much fiercer flyers than *Eurylaimus* He found them once in a flock hurrying about like Titmice, but very high up

CORYDON SUMATRANUS is a singular and rare bird Of its habits little or nothing is known However, it is crepuscular (very likely diurnal as well) and so stupid or tame as to allow itself to be pelted without moving

CORYGAUM, a small village on the right bank of the Bheemah river, half way between Poonah and Setoor on the Gor naddi It is memorable for the defence made on the 1st of January 1819, by a small body of Madras Artillery and Native Infantry, about 500 strong, against the entire army of Bajee Rao, peshwa About 4000 Arabs continued the attack from day break till dark, Asst Surgeon afterwards Sir James Wyllie, of the Madras medical department, greatly aided in their repulse The Indian Government erected a monolith column, on which are engraved an account of this defence, and the names of the dead and the survivors

CORYLUS, a genus of plants belonging to, the order Cupelliferæ *C laeera* and *C ferox* are found in the Himalaya

CORYLUS AVELLANA The Hazel is abundant in the Himalaya Fruits (nuts) called

Bindik and Finduk in bazars, are grouped in clusters together, inodorous, taste sweet and agreeable, become rancid very quickly By expression the kernel yields a very agreeable oil, nearly in the proportion of half its weight The wood of the hazel was the material of the divining rods of the magicians and snake enchanters, who even in modern times have had their believers in Europe — *O'Shaughnessy page 609*

This tree grows to a height of 10 feet, at elevations of 5,500 to 10,500 feet in the Punjab Himalaya, wood light and compact, the nuts edible — *Dis Cleghorn and J L Stewart*

CORYPIA, a genus of palms of the order Coccoaceæ, Sec D Coryphææ *C elata* and *C taliera* grow in Bengal, *C rotundifolia* and *C utan* grow in the Moluccas, *C umbraculifera* grows in Ceylon and the Moluccas and *C gebanga* grows in Java It seems to be *C gebanga* which Mr Wallace (p 158) describes as a great species in Lombok, called "Gubbong," which grows there in great abundance It has a lofty cylindrical stem, about a hundred feet high and two or three feet in diameter It flowers only once in its life in a huge terminal spike on which are produced masses of a small round fruit, of a green colour and about an inch in diameter, when these ripen and fall, the tree dies, and after standing a year or two, it too dies Flocks of green pigeons, and troops of the *Macacus cynomolgus* monkeys resort to the trees when fruiting, the latter chattering and showering down the ripe fruit

*C gebanga* has its young leaves plaited into baskets and bags affording much employment to the people in Java The leaves are also employed for thatching, and for making broad-brimmed hats *C trineri*, the Tara of Bengal and the Tahpat of the Peninsula, is much employed for making leaf hats and leaf umbrellas, the leaves, moreover, when smoothed, are much used for writing on, and also for tying the rafters of houses, as they are strong and durable *C umbraculifera*, the Coddapauna of Madras, and the Tahpat of Ceylon, and very like the former, is common in Ceylon, and found also on the Malabar coast Of this, the dried leaf is very strong and limber — and, according to Knox, "most wonderfully made for men's convenience to carry along with them, for though this leaf be thus broad enough to cover fifteen or twenty men when it is open, yet it will fold close

like a lady's fan, and then it is no bigger than a man's arm, it is wonderfully light" "This tree is, within, a pith only; they beat it in mortars to flour, and bake cakes of it, which taste much like to white bread, it serves them instead of corn before their harvest is ripe" (Knox's 'Ceylon') The Burmese books are all made of the leaf of a species of Corypha—Seeman Royle Fib Pl Voigt Wallace 158 See Corypha

## CORYPHA ELATA, ROXB

Tahera elata, Wall | Bujoor BENG  
Grows in Bengal and, according to Mr Mason, in the Tenasserim Provinces—Voigt. Mason

CORYPHA GEBANGA is one of the most useful of all the palms of South Eastern Asia. Its pith furnishes a sort of sago. In Java, thousands of boys and girls are employed in fabricating its leaves into baskets and bags, thatch, and broad brimmed hats are made of them, fishing nets and linen shirts are woven from its fibres, and ropes from its twisted leaf-stalks, the root is both emollient and slightly astringent, sliced, it is used in slight diarrhoea, and Wurtz says that it is a most valuable remedy for the periodical diarrhoea which in the East Indies attacks Europeans—Eng Cyc page 167 Seeman

## CORYPHA TALIERA, ROXB

Tahera Bengalensis, Spreng

Tara	BENG	Tali	MART
Tahera	"	Sri talam	SARS
Tarrit	"	Talipat	SINGH
Tahera	HIND	Sri talam	TIL

An elegant species of Bengal. The leaves are much employed for making leaf hats and leaf umbrellas, for tying the rafters of houses, as they are strong and durable. Its trunk is about 30 feet high, and as nearly as possible of equal thickness throughout. The leaves are in about 80 divisions, each 6 feet long by 4 inches broad radiating from the point of a leaf-stalk from 5 to 10 feet long, and covered with strong spines at its edge. Roxburgh describes the spadix as decompound, issuing in the month of February from the apex of the tree and centre of the leaves, forming an immense diffuse ovate panicle of about 20 or more feet in height. The fruit is the size of a crab apple, wrinkled, dark-olive, or greenish-yellow. The leaves are used by the natives of India to write upon with steel styles, it is known as the book palm, and is not unfrequent in the neighbourhood of religious edifices in the Tenasserim Provinces Voigt Eng Cyc, page 167 Dis, Mason Roxb n 174

## CORYPHA UMBRACULIFERA, LINN

Tali	BENG	Kodap an	MALAC
Po	BURM	Kondapanna marum	TEL
Fan palm	ENG	Sidalam	"
Talipat palm			

The Talipat palm of the Moluccas and

Ceylon, is similar in appearance to, but its leaves are not so round as those of, the taliera, the divisions in the centre being shorter than those at the sides. It has a stem 60 or 70 feet high, crowned with enormous fan shaped leaves forming a head forty feet in diameter, each leaf with 40 or 50 pairs of segments. These fronds when dried are very strong and are used for hats and umbrellas. The petiole is 7 feet long and the blade 6 feet long and 13 feet broad. Fans of enormous size are manufactured from this plant in Ceylon, the bole of this palm is wholly pith which furnishes a sort of flour from which bread is made, the leaves make excellent thatch, and are also used for writing on, like those of the C taliera. Griffith met with trees in flower at Margui which he thought belonged to this species but not having access to a complete copy of Martius' Palm, he could not speak with certainty, and Dr Mason saw trees in Tavoy which he regarded as probably talipat palms. The dark coloured roundish seeds of these trees are used as beads by the Tader or Dasari mendicants. C umbraculifera, is common in Ceylon, and is found also on the Malabar Coast, the dried leaf is very strong and limber—and, according to Knox, "most wonderfully made for men's convenience to carry along with them, for though this leaf be thus broad enough to cover fifteen or twenty men when it is open, yet it will fold close like a lady's fan and then it is no bigger than a man's arm, it is wonderfully light" "This tree is within a pith only, they beat it in mortars to flour, and bake cakes of it, which taste much like to wheaten bread, it serves them instead of corn before their harvest is ripe" And in Ceylon, umbrellas made of its leaf are so borne before the chiefs and nobles—Knox's Ceylon, quoted in Royle's Fib Pl Seeman, Eng Cyc page 176 Ann Mat Med p 143, Dis Mason Roxb n 177 Voigt

## CORYPHA UTAN LAM

Tahera sylvestris	Bl	Lontarus sylvestris	Rumph
-------------------	----	---------------------	-------

A palm of the Moluccas

CORYPHÆNA LINNÆUS A genus of fishes belonging to the section Acanthopterygii, family Scombroidæ, and fifth group Coryphænina. There are 9 genera in the group, one of them Coryphænina, in which there are six species.

CORYPHÆNA HIPPURIS LINN The Dolphin or Dorado is often confused with the Delphinus or Porpoise, from its bearing the same name. Its colours when swimming are very lively and of a golden yellow. It is good for eating—Bennett

CORYPHODON BLUMENBACHII, the Rat snake of Ceylon is almost domesticated

and is often kept in households — *Tennent Sk p 42*

CORYSTES, a genus of Brachyurons or short tailed Crustacea — *Engl Cyc. page 169*

COSCINIUM FENESTRATUM COLEB

*Menispermum fenestratum*, GÆRDN

Turmeric tree ENG | Jhar-ki Huldi DUK  
Mara munjil TAM | Mani prsupu TRI

A creeping plant, grows in Ceylon and in Southern India

COS A little Doonian island on the coast of Asia Minor, which fell under the power of Ptolemy. It was the first spot in Europe into which the manufacture of silk was introduced, which it probably gained when under the power of Persia before the overthrow of Darius. The luxury of the Egyptian ladies, who affected to be overheated by any clothing that could conceal their limbs, had long previously introduced a light thin dress, and for this dress, silk, when it could be obtained, was much valued, and Pamphilus of Cos had the glory of having woven webs so transparent that the Egyptian women were enabled to display their fair forms yet more openly by means of this clothing. Occasionally also, they sent their treasures and their children there as to a place of safety from Alexandrian rebellion, and there the silk manufacture flourished in secret for two or three centuries. When it ceased is unknown, as it was part of the merchants' craft to endeavour to keep each branch of trade to themselves. *Sharpe's Aristotle, Hist An V 19 History of Egypt, Vol I p 263*

COSHIA —? *Cochorus olitorius*

COSMAS, called from his maritime experiences, Indicopleustes, apparently an Alexandrian Greek, who wrote between 530 and 550, is the first Greek or Roman writer who speaks of China in a matter-of-fact manner and not as a land enveloped in half mythical haze. He speaks of it also by a name which no one has ever disputed to mean China.

He was a monk when he composed the work which has come down to us, but in his earlier days he had been a merchant, and in that capacity had sailed on the Red Sea and the Indian Ocean, visiting the coasts of Ethiopia, and apparently also the Persian Gulf, and the western coasts of India, as well as Ceylon. His book was written at Alexandria, and is termed "Topographia Christiana" "Universal Christian Topography," the great object of it being to show that the Tabernacle in the Wilderness is a pattern or model of the universe. Sir J E Tennent (Ceylon, I 542) says that Cosmas got his accounts of Ceylon from Sopatrus, whom he met at Adulc, and Lassen ascribes all Cosmas says of India to the same authority (n, 773). But they have not given the ground of these opinions.

One anecdote is ascribed to Sopatrus, no more. Writing of the Island of Taprobane in Further India, Cosmas says where the Indian Sea is, there is a church of christians with clergy and a congregation of believers, though I know not if there be any christians further on in that direction. And such also is the case in the land called Male, where the pepper grows. And in the place called Kalliana there is a bishop appointed from Persia, as well as in the island which they call the Isle of Dioscoris in the same Indian Sea. The inhabitants of that island speak Greek, having been originally settled there by the Ptolemies, who ruled after Alexander of Macedon. This Male is evidently Malabar, probably the Kalliana of the Periplus, which Lassen identifies with the still existing Kalyam on the mainland near Bombay. Father Paolino indeed will have it to be a place still called Kalyanapur on the banks of a river two miles north of Mangalore, but unreasonably. — *Via Galle, Indie Orientale, p 100 Yule Cathay I p CLXXI*

COSMEA BIPINNATA The species of the genus Cosmea, are mostly annuals and ornamental flowers, colours purple, white and yellow, the roots are tubercous, and may be cultivated by dividing the same or by seed. *Riddell*

COSMETIC BARK The fragrant bark of *Murraya paniculata*, a tree indigenous in Burmah above Rangoon, is more used for a cosmetic than sandal wood. It is a very ornamental fragrant flowering shrub of the citron tribe — *Mason*

COSMETIC TUBERCLES An inferior cosmetic wood of Burmah, is the tubercle of some plant. The Burmese appear, from their name, to regard them as produced by a species of erythrina, for they call them erythrina thorns, but Mr Mason knows the plant to be a creeper, and suspects that it is *Toddalia aculeata* and *T floribunda* — *Mason*

COSMETIC WOOD of Mergui is from one of the Xanthoxylaceæ? is a fragrant cosmetic wood sold in the bazar, which is said to come from Mergui, but Mr Mason never saw the tree. *Mason. See Abeer*

COSMIBUENA See Cinchona

COSS, or KOS The itinerary measure of India, of which the precise value has been much disputed, chiefly on account of the difficulties which attend the determination of the exact length of the guz, or yard. The Ayeen i-Akberee lays down distinctly that the coss consists of 100 cords (tunab), each cord of 50 Guz, also of 400 poles (bans), each of 12½ Guz, either of which will give to the coss the length of 5000 Guz. The following particulars relative to the distances between

the old muns or coss pillars may be interesting, and may be considered to afford the correctest means we have of ascertaining the true standard

	Round distance in English yards	Direct distance in ditto
Octagonal Munar to Nurchah in Delhi	4,513	4,189
Munar between Nurchah and Shapooragarhee	4,554	4,401
Munar opposite Aleepoor	4,532	4,379
Munar opposite Siraspoor	4,579	4,573
Remains of Munar opposite to Shalimar	4,610	4,591
A crane	4,558	4,487

Length of the coss—2 miles, 1 Furlongs 158 yards. It is important to observe that the length of the Ilhee Gun deduced from the measurements is 32½ inches, showing how very nearly correct is the length of 33 inches assumed by the British Government

This coss resembles the Chinese li, i.e., the distance which can be attained by a man's voice exerted in a plain surface, and the same may be remarked of the oriental Meel, as well as the European mile and league. The two former evidently derive their names from the Roman milliare, and the difference of their value in different places proves that the mere name was borrowed, without any reference to its etymological signification. Coss is an Indian word, the equivalent word in Persian is Kuroh, the same as the Sanscrit Krosa, of which four go to the Yojan, about the precise value of which different opinions are held. Malcolm says the coss is in general estimated at forty-two to the degree, but its length differs in almost every province of India. It may be computed as never under a mile and a half, and never (except in that introduced by the mandate of the late Tippoo Sultan in Mysore) more than two miles.

In Guzerat they estimate the coss by the lowing of kine (gao), which in a still day may be heard at the distance of a mile and a quarter. Thus twelve coss is bara gao—*Elliot Supp. Malcolm's Central India, Vol I p 20* See Ilhee Guz.

COSSACK, an irregular soldiery whom the Russian government recruited from the country at the foot of the Caucasus, known as Little Kabarda and Great Kabarda, bordering on the Malka and Kouma rivers. Cossack is also a term by which the Mahrattas describe their own species of warfare. In their language, the word Cossakee, borrowed, like many of their terms, from the Moghuls, means "predatory"—*Malcolm's Central India, Vol. I., p. 69* See Kabarda.

COSSÆA, or Cissia, is the name by which the Greeks knew the tract east of the Tigris. It was also called Elam or Elymais. It is now called Khuzistan, or the land of Khuz Kusa, the ancient name of the region now known as Beluchistan. Cossæa is supposed to be derived from Koh-siah, or "Black Mountain." The people spread their conquest over Susiana and the districts eastward. See Luristan, Viswamitra.

COSSEE, a river near Mhadcepooi in Midnapoor.

KO-SEIR or Cosseir, a town and harbour on the western side of the Red Sea. It was occupied by the French in their expedition to Egypt, and then by the British. Kosseir harbour is open to the east, but on the north reefs advance into the sea, on the south is a chain of mountains of some elevation. The bottom is rocky.

COSSIM BAZAR, a town near Murshedabad. In the early days of the British, a factory town.

COSSUMBA City. Safflower

COSSYAH, or Khassia country, on the north east frontier of India, has iron of great purity, smelted at Pundna, Cissia ligner is one of its principal articles of export, and a variety of parti coloured cloths, generally known by the name of Sylhet cloths. Some of them are dyed of rich colours, and being of a strong durable texture, are well adapted for table covers, to which purpose they are usually applied in the eastern part of Bengal. The Cossiah and Jyntia hill territory is administered by an assistant attached to the Assam commission. The value of the export and import trade of the country is about rupees 30,000 a year with Assam, and with the Bengal plains about 10½ lakhs, the exports being 7 lakhs. The total revenue from land and taxes in 1857 amounted to rupees 23,023. The first treaty with Jyntia was concluded in 1824. The rajah Ram Sing rendered no assistance during the Burmese war, but his country was taken under protection, and the rajah agreed to acknowledge allegiance to the British. The population of the Jyntia hills is about 40,000 souls, and of the Cossiah hills about 82,400. The Cossiah states are twenty five in number, of which five,

Cherra Poonjee,  
Khyrim,  
Nusting,

Sungree,  
and  
Nuspoong

are commonly called the "Semi independent States." The chiefs exercise civil and criminal jurisdiction over their own people in all matters pertaining exclusively to them. The minor states, known as the "Dependent States," are twenty in number, the chief of which is Nungklow.

Nunghlow,	Mowdun Poon-	Mowyang,
Moleem,	jee	Nobo
Murrow,	Mahrām	Sopho,
Ramyre	Mullai Chum-	Jeerung,
Mowhe,	mut,	Syung,
Cheyla,	Bhawul	Moflong Poon-
Dowarrah No-	Seenai Poonjee,	jee,
toormen,	Lengkhan Poon	Mowlong do.
Mowseuram,	jee,	Lyksom do

Moleem was conquered in 1829, and the rajah of Khyrim ceded to the British the territory to the S E of the Oomean or Booga Pane river. In 1861, the rajah was deposed and Malay Singh, a new chief, installed. No engagements have ever been made with Nobo, Sopho, Syung, Moflung Poonjee, and Lyksom Poonjee, but agreements have been entered into with Mowyang in 1829, Dowarrah Notoor-man in 1837, Soopar Poonjee in 1829, and in 1860, with Bhawal.—*Atchison's Treaties, &c*, page 85

COSSYA HILLS, estimated area 7290 sq miles, between 25° and 26° and 91° and 92°, Cheria Poonjee 4100 feet, 80 m in length from N. to S., and 40 in breadth, extend from lat 24° 35' to 26° 7' and from long 91° 35' to 92° 4'. About 16 m on the Sylhet side, and about the same on that of Assam, consists of lowland interspersed with small hills. In the interior, about 50 m in extent, is an undulating hilly table-land, from 1,500 to 2,500 feet high. Coal is said to abound in the hills of Jynteah. The localities admitting of cultivation are the plateaux of the Cossyah and Jynteah hills, the lower ranges on the Assam border, and the slopes towards the Sylhet plains. The area of the three plateaux is about 3,500 square miles, and their heights vary from 3000 to 6000 feet above sea level. The soil is a ferruginous red clay, with a subsoil of shingle little qualified for profitable cultivation. In the hollows, however, a fine black mould is found extending often over many acres. On the plateaux, miles upon miles of land are as level as the most highly cultivated portions of Kent and the Lothians. On the middle plateau the temperature averages that of the English summer, rising to 72° during the hottest months. The cold weather is less severe than an English winter. The cultivated land in those hills is very little. A late survey gave 12,221 acres or less than 10 square miles as the total in the Jynteah hills, while within an area of 4,450 square miles among the Cossyah hills only 30 square miles have been brought under crops. To the west of the Cossyah hills lies the Garrow country. The climate of the country is deadly, and the British have little intercourse with the Garrow. The Garrow in more immediate relation with the British either pay revenue or tribute in the shape of fines for offences. The others are usually considered independent

The Garrow were in the habit of making constant predatory incursions upon British frontier villages in the plains, and, decapitating their victims, and carrying off their heads as funeral offerings to their departed chiefs. It has frequently been found necessary to punish these outrages by sending military expeditions into the country, and by closing the markets in the plains frequented by the Garrow.

COSSYA, a tributary to the Ganges. It rises in the Himalaya mountains, in lat 28° 25' long 86° 11' S W, S E, S E, S E, S, into Ganges, length, 325 m. Arun, 310, Tambui, 95, Gogai, 235; Dud Coosy, 50, Tiljuga, 40 m—46,000 square miles drained. Where narrowest, and when lowest, stream 1,200 ft wide and 15 ft deep. It is larger than the Jumna or the Ghogra. It runs past Midnapoor cantonment.

COSSYPHUS See Coleoptera.

COSTUS.

Koost	ARAB	Koot	KASHM
Kust, Kóshta	BENG	Costus Arabicus	LAT
Putchuk	HIND	Koosht i Sherin	PERS

A fragrant substance highly prized by the ancients. It has been shown by Dr Falconer to be the produce of a genus of the thistle tribe, to which he has given the name of Aueklandia. He found it growing in great abundance all round the elevated summits of Cashmere. From the plants with which it was associated, and the circumstances under which the Koot grows, being one of the Compositæ, or Thistle tribe, with feathered seed, of which, when once established, the dissemination becomes easy, Falconer considered it could be produced to an unlimited extent, of the best quality, in the Himalayas, at elevations of from seven thousand five hundred to nine thousand feet above the sea, and that the Choor mountain alone might be brought in a few years to produce thousands of maunds of it. The root of A costus is supposed to be the Costus Arabicus on the following grounds. It corresponds with the descriptions given by the ancient authors, and is used at the present day for the same purposes in China, as costus was formerly applied to by the Greeks. The coincidence of the name, in Cashmere the root is called koot, and the Arabic synonym is said to be koost. It is a gregarious herb, about six or seven feet high, with a perennial thick branched root, with an annual round smooth stem, large leaves and dark purple flowers. The roots are dug up in the months of September and October, when the plant begins to be torpid, they are chopped up into pieces, from two to six inches long, and are exported without further

preparation The quantity collected, according to Dr. Falconer, is very large, amounting to about two million pounds per annum. The cost of its collection and transport to a mercantile depot in Cashmere is about 2s 4d the cwt. The commodity is laden on bullocks and carried to the Punjab, whence the larger portion goes down to Bombay, where it is shipped for the Red Sea, the Persian Gulf, and China, a portion of it finds its way across the Sutlej and Jumna into Hindostan Proper, whence it is taken to Calcutta, and bought up there with avidity under the name of putchuk. The value is enhanced at Jugadree, on the Jumna, to about 16s 9d or 23s 4d per cwt. In the Chinese ports it fetches nearly double that price per cwt. The Chinese burn the roots as an incense in the temples of their gods and regard it as aphrodisiac. The imports into Canton in 1848 were 414 piculs, and in 1859 were 854 piculs, and valued at 5,150 dollars. In Cashmere it is chiefly used for the protection of bales of shawls from insects. The exports from Calcutta were

in 1811 42 .. 12,847	In 1848 49 2,110	worth
„ 1847 48 .. 2,050	about	£1,500 annually

The sweet or mild kind, called koosht sheeren, is of light yellow colour and pleasant smell. Dr. Royle supposed it to be identical with the Indian orris root, but this is called bekhi banafsha, is imported from the Red Sea, and appears to be in every respect identical with the true orris root. Dr. O'Shaughnessy, writing in 1842, says putchuk is of unknown origin, though usually referred to *Costus arabicus* or *speciosus*, the roots of the latter are quite insipid and inodorous. Dr. Royle inclines to the opinion that it is in reality the produce of an umbelliferous plant, specimens have been seen by Mr. Beckett of Allypore having hollow stems—*Royle, p. 360 O'Shaughnessy, p. 652 Royle Productive Res Simmonds*

**COSTUS ARABICUS** LINN syn of *Costus speciosus*. The roots of *Costus arabicus*, Linn, *Falc.*, and *Costus speciosus*, formerly considered the source of this perfume. See *Costus*, *Putchuk*

**COSTUS ARGYROPHYLLUS** An indigenous species of the spirical *costus* is very abundant in Tenasserim—*Mason*. Dr. Wight has given figures of *Costus Nepaulensis* and *speciosus*

Cotton wool consists of the hairs attached to the seeds of species of *Gossypium*, and the plants have been characteristic of India from the earliest times, and at the present day, the great majority of its people are clothed with fabrics made from cotton, which is woven to a large extent in India, but largely also in Europe and America. In England, in 1861, there were upwards of 500,000 persons employed in the cotton manufacture, of whom nearly 400,000 were working in Lancashire, a number equal to 25 towns of 20,000 inhabitants each, all wholly engaged in the cotton trade. The engineers, mechanics, and the workers in iron, steel, brass, copper, tin, and wood, and the shopkeepers and other tradesmen supported by them may be reckoned at half that number (250,000). The women and children, and those not able to work and dependent entirely on the cotton operatives, may be taken as half those at work (250,000). The total number of persons then dependent upon the cotton manufactures may therefore be taken at 1,000,000, of whom 800,000 were in Lancashire and the immediate neighbourhood. The first distinct notice of cotton is in the Book of Esther, i v 6, where its Sanscrit name Karpas is translated greens, in the English Bible. Herodotus and Ctesias notice it, but it was not till the invasion of India by Alexander that the Greeks were acquainted with the plant, as may be seen in Theophrastus and also in Pliny. In America, two distinct varieties are indigenous, *G. Barbadosense*, yielding the cotton from the United States, and *G. peruvianum* or *acuminatum*, that which is produced in South America. India, also, has two distinct species, *G. herbaceum*, or the common cotton of India, which has spread to the south of Europe, and *G. arboreum*, or tree cotton, which yields little, if any, of the cotton of commerce, and is very distinct from the species of *Bombax* often called cotton-tree and silk

cotton-tree. The species of the genus *Gossypium* consist of large or small shrubs, and one forms a tree. All have alternate leaves, which are more or less palmate or lobed, and usually covered, as well as the young branches, with little black dots, and the nerves below have one or more glands. The flowers are large, showy, more or less yellow or red, consisting of five petals, united at their base, subcordate flat and spreading. Each cell contains from 5 to 7 ovoid seeds, from the seed-coats of which arises the filamentous substance, which by its twisting envelopes the seeds. Along with this cotton there is often a short covering, called fuzz by planters. Cotton wool is formed of tubular hairs, which, in drying, become flattened, and are transparent, without joints, and twisted like a corkscrew. Under water, they appear like distinct, flat, narrow, ribands, with occasionally a transverse line, which indicates the end of cells. This twisted nature of the cotton fibre is probably the reason why cotton cloth is not so well fitted as linen for surgical dressings. But being a worse conductor of heat than linen, it is well suited for inner clothing, where the object is to preserve uniformity of temperature, as it will retain heat, and prevent the body being so readily affected by external heat or cold. At the same time that it condenses less freely than linen the vapour of perspiration, but absorbs it readily when it has been condensed into the form of sweat (*Royle, page 289*). The cotton plant, *Gossypium herbaceum*, of which there are many varieties, is indigenous in the tropical regions of Asia, Africa and America. It flourishes also in the southern provinces of the United States, and, although an exotic there, has been cultivated with such success, that its produce is an important article of commerce. Cotton wool bears value according to its color, length, strength, and fineness of fibre. Pure whiteness is generally held to denote a secondary quality, whilst a yellowish tinge, provided it be not the result of casual exposure to damp, or the natural effect of an unfavorable season, is indicative of superior fineness. Many varieties of raw cotton are seen in commerce, each sort being usually distinguished by the name of the locality where it is produced, but the main distinction recognised is that between the long and short stapled qualities, though of these, again, there are different degrees of excellence. The "sea island" cotton of Georgia (so named from being raised on certain narrow sandy islets lying along the coast of that province) is esteemed the best of the long-stapled kind, and the "upland" produce of the same state excels amongst the short-stapled classes. The indigenous Asiatic cotton is exclusively

of the latter species The manufacture of cotton—an art in Europe of growth so recent as the end of the sixteenth or beginning of the seventeenth century—has been carried on in India from very remote antiquity As noticed above, Herodotus, and at a later period, Arabian, speak of certain wild trees in that country producing a kind of wool superior to that of the sheep of their day, and state that a cloth woven from this substance was in universal wear amongst the inhabitants in their time The natives had, indeed, attained such a perfection in the arts of spinning and weaving, that the lightness and delicacy of their finest cloths emulated the gossamer's web, and seemed to set competition at defiance Yet neither the extreme cheapness of his labor, nor his acknowledged manual skill, has enabled the Indian artisan to withstand the triumphs of mechanical genius And the striped and figured muslins of Dacca, so long celebrated throughout the world for the beauty and delicacy of their fabric, are now almost entirely displaced by the productions of Manchester and Paisley But cotton is nevertheless, even now, one of the leading features of Indian agriculture It forms part of an established course in most village lands throughout the plain country, and except upon swampy, desert, or absolutely sterile ground, there is no situation in which it cannot readily be grown Throughout British India, the aggregate extent of cotton growth was very recently no less than 5,147,223 acres The Board of Trade returns show that the total imports into Great Britain of Indian cotton, during five years (from 1849-50 to 1853-54,) were as under viz —

	lbs.
From Bengal,	10,573,653
„ Madras,	43,093,473
„ Bombay,	598,218,670

Total from India	652,785,801
From other countries	3,368,282,031

Total imported by Great Britain, 4,021,067,832

The indigenous plant of India is an annual, and succeeds best in the rich black soil that characterises various districts The American plant, though in reality perennial, is practically an annual in India, for in India neither native nor foreign cotton is cultivated on the same ground more than one year in three, its properties being found to exhaust the productive powers of the soil American cotton grows well on the black soil of India, but thrives still better on the light red lands. Each species possesses advantages

peculiar to itself The Indian variety is capable of being manufactured into fabrics of extraordinary durability and wonderful fineness, its color too is superior, but the staple short The American species on the other hand, excels in length of staple, the plant yields more flowers, and each flower a larger pod, whilst the quantity of seed contained in the pod is smaller and more readily separated from the fibre Mr Laing, in a letter to *The Times*, shows that Sir C Wood as to the future supply of Indian cotton, makes it entirely a question of price, citing the authority of Lord Hardinge ten years ago, while Mr Laing thinks that both climate and soil are so much against India, that its average produce per acre will never approach that of America, but he seems to exempt Dharwar Mr A N Shaw, who was Collector of Dharwar, collects both He expresses an opinion that while Mr Laing's facts may hold good of indigenous cotton, there are few parts of India where American cotton will not grow as luxuriantly as in Alabama, the best cotton field in America for green seed. The average produce per acre of seed-cotton of the whole cotton states is about 530 lb, 1,000 lb of seed-cotton is said to produce from 400 to 500 lb of marketable wool At Dharwar, in 1844, after a careful analysis, it was found that cotton grown from American seed yielded from 350 to 400 lb of seed cotton per acre Similar success was met with in Sind The following is the progressive advance in the cultivation of American cotton in Dharwar

ACRES UNDER CULTIVATION			
Years	American Cotton	Native Cotton	Total
In 1851	31,000	223,000	254,000
„ 1852	42,000	222,000	264,000
„ 1853	28,000	251,000	279,000
„ 1854	41,000	252,000	293,000
„ 1855	63,000	210,000	273,000
„ 1856	50,000	191,000	241,000
„ 1857	82,000	197,000	279,000
„ 1858	101,000	252,000	353,000
„ 1859	105,000	215,000	320,000
„ 1860	186,000	230,000	387,000
„ 1861	154,000	234,000	388,000
„ 1862	201,000	177,000	378,000

Mr Samuel Smith of Liverpool, in his Annual Cotton Circular at the close of 1862, gave

#### Import of Cotton into Great Britain

	American	East India	Brazil,	Egyptian, &c	Total
1861	1,811,000	986,000	208,000		3,005,000
1862	72,000	1,073,000	300,000		1,445,000

#### Export of Cotton from Great Britain

	American	East India	Brazil,	Egyptian, &c	Total
1861	263,000	409,040	5,000		677,000
1862	86,000	440,000	38,000		564,000

Thus Great Britain exported more than a third of its whole import

*Exports from India of Raw Cotton.*

1859-60	345,953,569	5,637,624			

The rulers of British India long ago made the first attempt to extend cotton cultivation, to improve the staple, and to establish better methods of cleaning and packing the produce, for the distribution of seed of a superior quality commenced so far back as the year 1788.

Nuima-bun cotton is grown in Malwa, and cultivated in small quantities all over Hindoostan, and its produce is in great request for the manufacture of the best kind of brahmical thread. It is a bushy plant, grows to the height of about seven feet, and lasts about six years.

In the Punjab, in 1866, the total area under cotton cultivation was about 624,193 acres, most in the Umritsur and Rawul Pindie divisions, and least in the Peshawar division, the Roh-tuck, Goordaspoor, and Umballa districts being those in which the largest extent of ground is sown with cotton, while in Simla and Sirsa districts it was hardly grown at all. The average produce per acre, after the cotton is cleaned from its seed, is a little over one maund (or 80 lbs), the rate varying from three maunds (240 lbs) in the Hooshyarpoor, to 16 seers (32 lbs) in the Kangra district.

Cotton grows to great perfection in Bundelkhand and its produce is not only more abundant, but also of a softer texture and of a whiter colour than that of the Doab; hence it bears a higher price and is more eagerly sought after. It has always formed the staple commodity of the Calpee market. The purchases of Government at one period amounted to forty lakhs a year, and of private individuals, it is said, to 18 lakhs. In 1830, the former were discontinued and the latter dwindled down to an annual expenditure of barely seven lakhs.

The Doab, as well as Bundelcund, have always grown considerable quantities of cotton—(*Royle Bonyngue America*, page 38).

The cotton of Jaloun and Jhansi (writes Mr Bell) was formerly much celebrated. Koonch is now the great mart in that direction, and it is surrounded by the Jaloun territory. Mr Bell, after making careful inquiries, ascertained that the cotton of Baugchenee was that which then was in most

repute with the natives of those parts, who gave about  $7\frac{1}{2}$  per cent more for it than for the other best kinds. The district is on the south of the Chumbul, near Dholpore, and therefore probably very similar in soil and climate to that of Jaloun and Jhansi, which are not very far distant. As these districts, as well as Bundelcund, lie to the westward of the Jumna, and have always been famous among the natives for their cotton, it is probably owing to some physical peculiarities of soil, or of climate, that the cotton is produced of a better quality, for we cannot discover that it has the advantage of any more careful culture or cleaning—(*Royle*).

Mr Mercer, an American planter, reported "Dharwar as more like the Mississippi climate than any other he met with in India. The elevation modifies the climate, which also feels the influence of both monsoons or rains, so that it never becomes extremely dry, and is never inundated with excessive rains," and the seed returns to its original Mexican character, instead of deteriorating as in other parts of India. (*Bonyngue America*, pages 16 to 40). The mode of improving the Indian cotton, which seems to hold forth the surest promise of eventual success is to bestow all possible attention upon the culture of New Orleans, Mobile, Upland, or Mexican cotton which (in India) are practically one and the same variety, the denomination only varying according to the locality from whence imported. This is the sort of cotton for which there would always be an unlimited demand at Manchester. The proportion of its seed being considerably less than that of most other cotton, an equal area sown with New Orleans is more valuable than if sown with other exotic or indigenous Indian seed; it gives a larger yield. It yields more wool in proportion. It commands a higher price in the market. It requires no peculiar mode of culture or treatment, other than is applicable to indigenous species. When this class of cotton shall gain a firm footing in India, it must rest entirely with the discretion of cultivators and dealers, whether they will attempt introducing the finer staples in particular localities. But the New Orleans seed must be relied upon as the most generally remunerative, and the most universally suitable to Indian soils and climates. In the Southern Mahhatta country one cwt of clean cotton per acre may be accounted a fair yield—(*Dublin University Magazine*, June 1857).

Between the Jumna and the Ganges, there are 20,000 square miles of soil which nature seems to have intended for one vast cotton field. There is the great depth of sandy loam

into which the long tap root of this plant may delve and there are the fertilizing rains, and, failing them, the facilities of irrigation, which that tap root requires, in order to suck up sustenance. There is the hot sun to draw the fruit to maturity, and there also is a redundant population to go forth and gather the harvest. These are the conditions under which cotton becomes an enormous produce.

Cotton grows luxuriantly on the sea-board of Cutch, and in the fertile peninsula of Guzerat.

*Derar*—The grand cotton-field of India, however, lies partly within the dominions of the Nizam, and partly in the province of Nagpore. The extent of cotton cultivation throughout this vast tract cannot be estimated with any near approach to accuracy. But this region is beyond doubt the part of India from which the largest supply must ever be hoped for. Chumlee, a very fine cotton fabric of India, so costly as to be used only in native courts, is made from Derar, or Omraotee, cotton. The chief care is bestowed on the preparation of the thread which, when of very fine quality, sells for its weight in silver. The weavers work in a dark under ground room, the walls of which are kept purposely damp to prevent dust from flying about. Omraotee cotton is alone used (*Llhot*). It is stated on the authority of Mr. Perry, "the most practical and skilled of the American planters formerly employed experimentally by Government," that "the plant yielding what is known in the market as Omraotee cotton, and which, probably, does not differ from that of Guzerat, is a distinct variety from that of other parts of India, having three lobes only in the capsule, while the latter has four, and that that cotton, if well prepared, is equal to any American cotton for the great bulk of the manufactures of England."

Mr Talboys Wheeler, who wrote the Cotton Hand-book for the Madras Presidency, drew the following four general conclusions, viz

1st American cotton can be grown, but the profit is questionable

2nd Indian cotton may be improved, but only to a degree

3rd American cotton must always command a higher price than Indian

4th The demand for Indian Cotton must always depend on the supply of American. But a superior cotton can undoubtedly be raised in the Carnatic at a cost not exceeding the production of the common native fibre. The tenure of land in the Madras Presidency leaves the ryot free to grow what crop he pleases, there is no export duty or special tax on cotton, and the assessment is nowhere heavy. The exports of cotton from the

Madras Presidency have increased of late years, and if cotton be still not grown in the quantity or of the quality desired, the cause must be that some other crop is more remunerative to the ryot. A steady market at a remunerative price is the great want, and this the mercantile community alone can supply. There is grown in India a vast supply of cotton and it is capable of increase by extended cultivation consequent on increased demand. A large portion of the existing supply is absorbed by the local manufacturers, but is capable of diversion if increased prices are offered by exporters. The diversion to other markets may be immediate, but an increase requires the lapse of at least one season after the demand arises, and some prospect of a continuance of that demand. Every rise in price of Indian cotton in England, however small, if likely to be permanent, exercises an immediate effect on the export of cotton from India to England, the quality is capable of great improvement, but by a more tedious process. The American cotton plant cannot withstand so much drought as the Indian. The ordinary native cotton cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe.

At Coimbatore, the *Oopum* or best indigenous cotton is raised in rotation of two years, with cumboo, *Panicum spicatum*, and cholam, *Sorghum vulgare*. The *Oopum* cotton is raised on black soil, but the little *Bombon* cotton is grown in red soil. *Gossypium Indicum* grows wild in Sind and the Panjab.

Cotton is grown in drills in Bellary, along with cholam or millet, with the former the drills are about six feet apart, and have from four to six rows of cholam, between each one of cotton, with the latter, the drills of cotton are only three feet apart, and have two rows of millet between them. When the crop of the millet is cut down, a very singular and sudden change occurs, one day nothing is seen but yellow grain, which, on the next, disappears, and a thick crop of green cotton, about half a yard high, remains. None of the fields are enclosed, but they are generally protected at the sides of the road, by rows of the prickly Jamaica yellow thistle, *Argemone Mexicana*.

In Mysore, large belts of land in the northern and central talooks are deemed excellent for cotton culture.

In Ceylon, cotton is grown very generally both by the Singalese and Tamul races, but upon no regular plan nor to any extent.

In Bengal the cultivation of cotton is considerable, except in Assam, Tipperah, and Chittagong. In the two latter districts a large export trade in this article appears

to be growing up, but, with this exception, the whole of the cotton of lower Bengal is retained for its own consumption. It is found that any decline in native weaving is confined to the towns, in the villages it is still going on much as usual. In the villages both the cotton growers and those who receive cotton from them as a payment in kind, find it more convenient to make their own cloth at home than to purchase it ready made. The women spin the thread, and the village weaver is then hired to manufacture the piece, or the work is given out to him by the job, and he is paid in cotton. Thus, whilst the weavers in town are unable to purchase cotton from its excessive dearth, the weavers in villages are supplied with the material by the persons who employ them, and who also pay them in cotton. In the eastern districts, cotton weaving has declined altogether, simply from the fact that there is little local cultivation, and, consequently, the facilities indicated are not afforded to the native weavers, and the demand for native goods is greater than in the western districts.

In the lower provinces of Bengal, where the cultivation of the plant is almost entirely limited to the requirements of the local population, there are five districts—viz, Chittagong, Cuttack, Munbhoon, Loharnugui, and Assam—in each of which upwards of 10,000 acres of soil are so appropriated of cotton culture. And in some of these, as well as in several other districts where the present acreage is considerably less, it is known that the cultivation might be widely extended. In the North-Western Provinces a return showed that cotton is, more or less, grown in every pargunnah or district—from Kumaon, with 260 acres, to Banda, which exhibits 230,557 acres under cultivation. The eastern shores of the Bay of Bengal are no less favorable to the production of cotton. The indigenous cotton of Dacca has long been celebrated for its superior quality. It is cultivated along the banks of the Megna from Feringy bazar to Edilpore in Backergunge, a distance of about forty miles, on the banks of the Brahmaputra creek (the ancient channel of the river of the same name), and along the Luckna and Banar. It presents different shades of quality, the finest of which is named photee, and is the material of which the delicate muslins are made. It is described by Roxburgh as differing from the common herbaceous cotton plant of Bengal in several particulars, but chiefly in having a longer, finer and softer fibre than it.

The Sea-Island variety was formerly successfully grown in the Sunderbuns. About the year 1833, the late Mr James Kyd

called attention to the soil of the Delta of the Hooghly as, in his opinion, admirably adapted to the culture of American cotton of the black-seeded long staple variety. A small quantity, raised by him in 1833 on Saugor Island, from Sea-Island seed, was pronounced by good judges of the article as the best they had seen of Indian growth. On comparing this cotton with that grown near the Mutla, and, allowing for deterioration from age, the latter is superior to the former in every respect. The unusually heavy inundation of the sea, in 1833, swept away the various cultures introduced on Saugor Island, and with them this thriving cotton plantation.

In Burmah, the description of cotton grown is almost all of indigenous growth, (*Gossypium herbaceum*) and it reaches a very fine staple. The soil on which it thrives best is the alluvial deposit left by the numerous mountain streams and rivulets on their subsidence at the close of the south-west monsoon. It also grows very well on recent forest clearings, where, often, soils containing a considerable portion of peaty matter and lignite are met with, and appear very suitable for the good of the plant. It appears to thrive also in a limestone soil, which abounds in these provinces.

The average produce of cotton in Amherst Province for five years was calculated as follows —

Years	Acres	Mds	Years	Acres	Mds
1856-57	325	1398	1859-60	320	1375
1857-58	315	1354	1860-61	211	907
1858-59	379	1628			

An acre is estimated to yield about  $4\frac{1}{2}$  maunds of cotton, value 15 Rupees, and which when ginned was sold in the Moulmein bazars at an average of Rupees 24. Several efforts had been made to induce the Burmese peasant to take to the culture of foreign cotton, but he was most impracticable in this respect. In Tenasserim a small quantity of Pernambuco cotton (*Gossypium acuminatum*) was grown from seed introduced by Mr Blundell and Major Mac-Farquhar, it appeared to flourish well, but is cultivated generally about houses in a very insignificant quantity.

*Borneo* — Cotton is grown by the sea Dyaks of Borneo, sufficient in quantity for their own use, and to make cloths for exportation.

*China* has been a largely importing country. The cotton growing area in that country is, however, very large, the population dense and

industrious. — (*Low's Sarawal* p 55 *Dublin University Magazine*, June 1857)

America — Mr Bonynge, an American gentleman long resident in India, was of opinion that America has reached her utmost limit of producing cotton, and that India must be depended on in future. He stated that in America there had been a falling off in progressive increase of 51½ per cent and that probably in the next ten years there would be no increase over the last ten. So it may be said, he adds, that the production of cotton in America has not increased materially for twelve years—there having been only an increase of 160,000 bales yearly, over the former six. From the year 1839 to 1850 the cotton crop in America was comparatively stationary in quantity, and the cotton crop realized more in dollars for five years—from 1855 to 1860—than in the two following periods from 1840 to 1845, and from 1845 to 1850. He concluded, that cotton admits of no further increase for the employment of additional hands, and the cotton states complain that the land yields them nearly one third less produce, and sells for one-third less price. Cotton planting in the Eastern States is below 20° N. It will not even do well low down in Florida and the chief cultivation is northwards of the 27 deg to 36 deg N latitude. Probably India produces twice the quantity that America does. Americans consume 11½ lbs per head and it has been calculated that the East Indian people consume 20 lbs per head, but Great Britain only 1½ lbs per head.

Indian Cotton is somewhat difficult to spin, from its often breaking, and requiring more turns of the spindle, from its shortness of fibre, than that of America. But the yarn made from a pound of East Indian cotton which cost 3½ pence sterling, will sell for 7 pence, while, from the American, which cost 1½ pence the lb, the yarn sells for 7½ pence.

Native Indian Cotton is a small podded, small seeded, short-stapled variety but in picking the seed in carefully gathering and ginning, it may be much improved. Dr Cleghorn mentioned that he had examined and compared all the species of *Gossypium* in the Herbarium of the Botanical Society (comprising the collections of Buchanan Hamilton and Lady Dalhousie, with contributions from Wight, Campbell, &c) and also those in the Herbarium of Professor Balfour, with a view to expiate the specific characters by which to discriminate them from one another. He considered the entire series remarkable, as showing the striking differences which soil, climate, and culture produce in species, and which may appear in nature, giving rise to a multiplica-

tion of species. The whole group of so called species seemed to him referable to *G. herbaceum*, *Linn*, *G. arboreum* *Linn*, *G. barbadense*, *Linn*, and *G. acuminatum*, *Roth*.

Testimony is, now, conclusive that India can grow the New Orleans plant as well as the native one. Mr Shaw says, on this point (Cotton Report, pages 318 and 319),—the plant from New Orleans seed is as hardy as the native one, and the return much larger. The only cotton that can compete with the American is the New Orleans, or other imported staples, but never the native one.

Experiments in Darwar were commenced by him in 1812. The Government afterwards sent down one American planter and one English planter, who had farms of their own. They were abolished because they did nothing. The ryots cultivated better. When he left, in November 1817, 25,000 acres of land were under New Orleans cotton. He did not at all interfere with the planters. His object as Collector was to beat the planters, if he could, with the ryots, and he did beat them.

Dr Wight says, (Cotton Return, page 337), the New Orleans plant is constitutionally is well adapted for sustaining the high temperature of our Indian hot season as even the native one, and after a temporary check from long continued drought, it revives fully as quick as the other.

Mr Simpson, an American planter, says (page 380,) three years of experience at Coimbatore, has convinced me that the natives are, and must ever remain, the cultivators of the soil, and cotton culture will always be carried on in their own way.

Mr Shaw says (at page 186, Cotton Report,) Cotton cultivation in India would not be a profitable speculation for Europeans: the natives can grow it much cheaper. Our function is simply that of buyer. We have no local market for the American cotton. It does not answer for native spinning so well as their own.

From the year 1829, indeed ever since 1790, till the present, the efforts to improve the cotton crops have been almost continuous. Experienced planters from America were employed, and Drs Wight and Watson were long engaged in experiments in Coimbatore, Guzerat and Dharwar. The plant has always been grown in almost every district of India, for local use or export, in soils suitable and unsuitable to its growth, and at the London Exhibition of 1862, the values of 138 samples exhibited ranged from sixpence to three shillings the pound.

The successful agent in the Dharwar experiments with exotic seed, Mr A N Shaw of the Bombay Civil Service, was transferred to Dharwar in 1842. The success of the Dharwar experiments was not immediate. Mr Shaw had failures and disappointments to encounter as others have had, but his perseverance at last commanded favorable results. The long extent of sea-coast about Surat and Broach, embracing many hundred miles, would seem particularly well adapted to the culture of the more valuable staples—such as Sea island, Pernambuco, Egyptian, and Bourbon, but the scene of Mr Shaw's labors was laid in a district where the soil and climate have long since been recognized as eminently suitable to the growth of cotton.

**Foreign Cotton** A Bengal Civil Servant, located during ten years in the North-Western Provinces, cultivated Mexican cotton, and the acclimated produce was pronounced excellent in Lancashire. The average yield per acre was from 200 to 250 lbs of clean cotton. Practical experience may, therefore, be safely represented as establishing the fact that India can produce excellent exotic cotton. Dr Wight of the Madras Medical Service, who for eleven years superintended the Coimbatore experiments, informed the Committee of the House of Commons [Indian Territories, Fourth Report, Quest 5,952, et seq] that Coimbatore cotton selling in Liverpool at 4d per lb, would barely remunerate the grower. But prices vary with the fluctuations of American cotton, and "outs," says Dr Wight, "has always borne nearly the same prices in Liverpool as American grown cotton, under the same denomination, bore there." Thus, the Coimbatore produce was generally ranked as "fair" and "good fair," and on the very day (6th June 1853) when Doctor Wight gave his evidence, cotton under that denomination was fetching in Liverpool from

American cotton was introduced, and large quantities of seed distributed, among the ryots in the Raichore Doab under Capt Taylor's supervision, and the cultivation of it had continued to increase up to the time of the restoration of the district to H H the Nizam in the beginning of 1861. The total number of acres in that district under cotton cultivation is shown below, and, separately, that portion producing American cotton.

Fuslee year	Indigenous cotton, No of acres cultivated	American cotton, No of acres cultivated	Total acres
1267	1,99,204	630	1,99,834
1268	2,43,781	2837	2,46,618
1269	2,38,221	5571	2,43,795

White jowarice, wheat, linseed, flax, turmeric, &c, are all produced on dry black cotton soils, but they take their turn in rotation with cotton, which is generally sown every second year.

**Yield** In the N W Provinces of India, the yield varies from 2 to 6 maunds of uncleaned cotton per acre, and of cleaned cotton less than from 30 seers to 1 maund and 35 seers, but in the S E parts of the N W Provinces, cotton is often sown along with arhar and sesamum so that it ranges per acre, from 4 to 6 mds of unclean and from 1½ to 2 mds of clean cotton. Messrs Fischer and Co produced 41½ lbs per acre of clean Opium cotton, and 60 lbs per acre of clean Bourbon cotton. The average cost of cultivating a bhar of the cotton plant in the Broach district, including rent and all charges, is Rs 15. The average quantity of the cotton plant which yields a candy of cotton of 784 lbs is 2½ bhar. Therefore, the cost of a candy of cotton does not exceed, on an average, Rs 15 × 2½ = Rs 37½. While the average price paid the ryots, for a candy of cotton in the seed, during six years, was Rs 88¾ or Rs 35½ per bhar. A ryot cultivated forty begahs of cotton and they produced ten bhar of cotton. At the rate of Rs 15 per bhar, the total cost to him of these ten bhar, including rent and all charges, was Rs 150. The price paid to him for it was Rs 360.

It has been stated by Dr Wight, that the average consumption of cotton by the inhabitants of Hindostan amounts to not less than twenty pounds for each person. This would give a local annual consumption of 3,000,000,000 lbs, and with the quantities taken by Great Britain and China, a total yearly crop of 3,110,000,000 lbs.

*Varieties* In commerce, Indian cotton was known under the names of Surat, Tinnevely, Bengal, Broach, &c, according to the locality of its growth or place of shipment. Amongst commercial men the term Surat included the produce of Surat, Berar, and Broach, with occasionally some from Dacca, it came mostly from Bombay. The Madras cottons are those shipped from Tinnevely, Coimbatore, and other parts of that Presidency, whilst the Bengal takes in Bundelcund, Nagpore, and the far northern provinces. Examined under a microscope the staple of these sorts appears to range from seventeen-twentieths to one and one-tenth of an inch in length, the staple of the celebrated Sea Island cotton being usually an inch and a half in length.

The varieties of cotton known in the commercial world may be referred to three distinct species, each having several sub-varieties. The *Gossypium barbadense* is the species cultivated in the West Indies, North America and in one or two parts of the peninsula of India. *Gossypium peruvianum* yields the cotton of Brazil, Pernambuco, Peru, &c. This also has been introduced into some districts of India. *Gossypium indicum* is the species which, in a number of varieties, produces the great bulk of the cotton of India and China. There is a fourth species, also, the *Gossypium arboreum*, or Tree cotton of India, peculiar to India alone, it is unfitted for manufacturing purposes, unknown to commerce, though yielding a beautifully soft and silky fibre, admirably adapted for padding cushions, pillows, &c.

Of the Indian species there are many varieties, each possessing some distinguishing character of its own, arising from mode of treatment, soil &c. It usually attains a height of four or six feet, is bi-triennial, but may be equally cultivated as an annual, germinating and ripening its seeds within a period of from four to eight months. The leaves are five lobed, flowers are usually found blossoming singly at the extremity of the branches, the petals being of a yellow colour, with a small purple spot near the claw. The seeds are five in number, and are clothed with a firmly-adhering greyish down beneath the short white wool of the capsule. The qualities by which the value of cottons are determined may be confined to three viz, length of staple, strength of fibre, and cleanness of sample. Colour, which at one time was thought much of, is no longer looked upon as a matter of moment. Inferior as the cotton of India is allowed to be, as regards its staple and purity, there is every reason to believe that in durability it at least equals the produce of any part of America, and of this

fact the hindoos are themselves perfectly aware. Dr. Royle gives three distinct varieties of cotton all indigenous to Hindustan. The common description is found scattered more or less throughout India, reared as a triennial or annual. It reaches the height of five or six feet in warm, moist climates, the seeds are five in number, clothed with a short greyish down. In the peninsula there are two distinct species of this sort, known amongst the natives as *Oopum* and *Nadum*. The first thrives only on the richest black soil, and is an annual, producing a fine staple; the latter is a triennial plant, and grows on the poorer red soil, yielding small crops of inferior quality. Next to these we have the Dacca cotton, as a distinct variety of the *Gossypium Indicum*. It differs from the previous variety in the plant being more erect, with fewer branches, and tinged with a reddish hue, whilst the cotton is finer, softer, and longer. This variety is reared more or less extensively throughout Bengal, especially in the Dacca district, where it is employed in the manufacture of the exquisitely fine muslin cloths known over a great part of the world as Dacca muslins and whose delicacy of texture so long defied the imitation of the art-manufacturers of the West.

A third variety is the cotton grown in Berar, in the northern provinces of the Madras Presidency, and in Surat and Broach. This plant attains a greater size than the preceding, bears for a longer period, and produces a fibre of a finer quality than the former. It appears to thrive best on a light black soil.

*Soil* The soil in which all these Indian varieties thrive may be classed under two distinct heads, the black cotton soil and the red cotton soil. The former, as its name indicates, is of a black or deep brown colour, of a clayey nature, forming in the rains a heavy tenacious mass, and drying into solid lumps in the hot months. An analysis of this gives 74 per cent of silica, 12 of carbonate of lime,  $7\frac{1}{4}$  protoxide of iron, 3 of alumina, 2 of vegetable matter and  $\frac{1}{2}$  salts, with a trace of magnesia. The red soil of India has been found in some localities better suited to the growth of cotton than the black earth. It is a rather coarse yellowish red soil, commingled with particles of the granitic rocks,—silica, felspar, and aluminous earth. It mainly differs in composition from the preceding in the iron existing in the state of peroxide or red oxide, whilst the carbonate of lime is found present in greater abundance. Analyses of the best cotton soils of America prove that they differ from those of India chiefly in the large por-

tions of peaty matter contained in them.—*Capper's Three Presidencies*, page 26.

*China Cottons*—The yellow Cotton from which the beautiful Nankin cloth is manufactured is called Tze me-wha, by the Chinese. Although the yellow variety has a more stunted habit than the other, it has no characters which constitute a distinct species. It is merely an accidental variety, and although its seeds may generally produce the same kind, they doubtless frequently yield the white variety, and vice versa. Hence, specimens of the yellow cotton are frequently found growing amongst the white in the immediate vicinity of Shanghai, and again a few miles northward, in fields near the city of Poushan on the banks of the Yang-tze kiang, where the yellow cotton abounds. Mr Fortune often gathered specimens of the white variety *Nankin Cotton* is chiefly cultivated in the level ground around Shanghai, where it forms the staple summer production of the country. This district, which is part of the great plain of the Yang-tze-kiang, although flat, is yet several feet above the level of the water in the rivers and canals, and is consequently much better fitted for cotton cultivation than those flat rice districts in various parts of the country,—such for example as the plain of Ningpo, where the ground is either wet and marshy, or liable at times to be completely overflowed. Some fields in the Shanghai district are, however, low and marshy, and these are cultivated with rice instead of cotton, and regularly flooded by the water wheel during the period of growth. Although the cotton land is generally flat, so much so, indeed, that no hills can be seen from the tops of the houses in the city of Shanghai, it has nevertheless a pleasing and undulating appearance, and taken as a whole it is perhaps the most fertile agricultural district in the world. The soil is a strong rich loam capable of yielding immense crops year after year, although it receives but a small portion of manure. The manure applied to the cotton lands of the Chinese is doubtless peculiarly well fitted for this kind of crop. It is obtained from the canals, ponds, and ditches which intersect the country in every direction, and consists of mud which has been formed partly by the decay of long grass, reeds, and succulent water plants, and partly by the surface soil which has been washed down from the higher ground by the heavy rains. Every agricultural operation in China seems to be done with the greatest regularity at certain stated times, which experience have proved the best, and in nothing is this more apparent than in the manuring of the cotton lands. Early in April the agricultural labourers, all over the country, are

seen busily employed in cleaning these ponds and ditches. The water is, first of all, partly drawn off, and then the mud is thrown upon the adjoining land to dry, where it remains for a few days until all the superfluous water is drained out of it, and is then conveyed away and spread over the cotton fields. Previous to this the land has been prepared for its reception, having been either ploughed up with the small buffalo plough in common use in the country, and then broken and pulverised by the three pronged hoe, or in those instances where the farms are small and cannot boast of a buffalo and plough, it is loosened and broken up entirely by manual labour. When the mud is first spread over the land, it is, of course, hard or cloggy, but the first showers soon mix it with the surface soil, and the whole becomes pulverised, and it is then ready for the reception of the cotton seed. Road scrapings and burnt rubbish are saved up with care, and used for the same purpose and in the same manner. A considerable portion of the cotton lands either lie fallow during the winter months, or are planted with those crops which are ready for gathering prior to the sowing of the cotton seed. Frequently, however, two crops are found growing in a field at the same time. Wheat, for example, which is a winter crop, is reaped in the Shanghai district generally about the end of May, while the proper time for putting in the cotton seed is the beginning of that month or the end of April. In order, therefore, to have cotton on the wheat lands, the Chinese sow its seeds at the usual time amongst the wheat, and when the latter is reaped, the former is several inches above ground, and ready to grow with vigour when it is more fully exposed to the influence of sun and air. The Shanghai season—that is, from the late spring frosts to those in autumn—is barely long enough for the production and ripening of the cotton, as it is easily injured by frost, and the Chinese farmer is thus obliged, in order to gain time and obtain two crops from this ground in one year, to sow its seeds before the winter crop is ready to be removed from the ground. When it is possible to have the first crop entirely removed before the cotton is sown, it is much preferred, as the land can then be well worked and properly manured, neither of which can otherwise be done. The method of sowing one crop before the preceding one is ripe and removed from the land is very common in that part of the country, and even in autumn, before the cotton stalks are taken out of the ground, other seeds are frequently seen germinating and ready to take the place of the more tender crop. In the end of April and beginning

of May, the land having been prepared in the manner just described, the cotton seeds are carried in baskets to the fields, and the sowing commences. They are generally sown broad cast, that is, scattered irregularly over the surface of the ground, and then the labourers go over the whole surface with their feet and tread them carefully in. This not only embeds the seeds, but also acts like a roller to break and pulverise the soil. Germination soon commences, the seeds rooting first in the manure which had been scattered over the surface of the land. In some cases the seed, instead of being sown broadcast, is sown in drills or patches, but this mode is less common than the other. The rains, which always fall copiously at the change of the monsoon which takes place at this season of the year, warm and moisten the earth, and the seeds swell, and vegetation progresses with wonderful rapidity. Many of the operations in Chinese agriculture are regulated by the change of the monsoon. The farmer knows from experience, that, when the winds, which have been blowing from the north and east for the last seven months, change to the south and west, the atmosphere will be highly charged with electric fluid, and the clouds will daily rain and refresh his crops. The cotton fields are carefully tended during the summer months. The plants are thinned where they have been sown too thickly, the earth is loosened amongst the roots, and the ground hoed and kept free from weeds. If the season be favourable, immense crops are obtained owing to the fertility of the soil, but if the weather happen to be unusually dry from June to August, the crop receives a check which it never entirely recovers, even although the ground after that period should be moistened by frequent showers. The year 1845 was a season of this kind, and the crop was a very deficient one, compared with that of 1844. The spring was highly favourable, and the plants looked well up to the month of June, when the dry weather set in, and gave them a check from which they never recovered. Abundance of rain fell later in the season, but it was then too late and only caused the plants to grow tall and run to leaf, without producing those secretions which ultimately go to the formation of flowers and seed. The cotton plant produces its flowers in succession from August to the end of October, but sometimes, when the autumn is mild, blooms are produced even up to November, when the cold nights generally nip the buds, and prevent them from forming seed. In the autumn of 1844 this happened on the night of the 28th of October, when the thermometer sunk to the freezing

point, and ice was found on the sides of the canals and ponds. As the pods are bursting every day, it is necessary to have them gathered with great regularity, otherwise they fall upon the ground and the cotton gets dirty, which of course reduces its value in the market. Little bands of Chinese are now seen in the afternoon in every field, gathering the ripe cotton and carrying it home to the houses of the farmers. As the farms are generally small, they are worked almost entirely by the farmer and his family, consisting sometimes of three or even four generations, including the old grey-haired grandfather or great grandfather, who has seen the crops of four score years gathered into his barns. Every member of these family groups has a certain degree of interest in his employment, the harvest is their own, and the more productive it is, the greater number of comforts they will be able to afford. Of course, there are many cotton farms of larger size, where labourers are employed in addition to the farmer's family, but by far the greater number are small and worked in the way we have just described. It is no unusual sight to see the family goats, too, doing their share of the work. Several of these animals are kept on almost every farm, where they are, of course, great favourites with the children, and often follow them to the cotton fields. Although the children with their little hands can gather the cotton as well as their elders, they are not strong enough to carry it about with them, and it is amusing to see their favourites the goats, with bags slung across their backs, receiving the deposits of cotton and bringing it home to the houses, evidently aware that they too are working for the general good. However fine the crop may be, the Chinese are never sure of it until it is actually gathered in, much depends upon a dry autumn, for, if the weather is wet after the pods begin to burst, they drop amongst the muddy soil, and are consequently much injured, if not completely destroyed. When the cotton reaches the farm yard, it is daily spread out on hurdles raised about four feet from the ground and fully exposed to the sun. As the object is to get rid of all the moisture, it is of course only put out in fine weather, and is always taken into the house or barn in the evening. When perfectly dry, the process of separating it from the seeds commences. This is done by the well known wheel with two rollers, which when turned round draws or sucks in the cotton, and rejects the seeds. It is a simple and beautiful contrivance, and answers well the end for which it is designed. The cotton is now sent to market, and a portion of the seeds are reserved for the next

year's crop Early in the fine autumnal mornings, the roads leading into Shanghai are crowded with bands of labourers from the cotton farms, each with his bamboo across his shoulders and a large sick of cotton swung from each end With these they hurry into the town, for the purpose of disposing of them to the merchants, who have numerous warehouses from which they send the cotton to the other provinces of the empire These labourers or small farmers, for many of them bring their own produce to market themselves are very independent in their dealings Having reached the first warehouse, the cotton is exposed to the view of the merchant, who is asked what price he intends to give for that particular quality, and should the sum offered be below the owner's expectations, he immediately shoulders his load and walks away to another merchant At this season it is almost impossible to get along the streets near the sides of the river where the cotton warehouses are, owing to the large quantities of this commodity which are daily brought in from the country It is bought up by the large cotton merchants, who empty it out in their warehouses, and then repack it in a neat and compact manner before it is conveyed on board the junks Before the cotton is converted into thread for the purpose of weaving, it is cleaned and freed from knots by the well known process common in British possessions in India This is done by an elastic bow, the string of which being passed under a portion of the cotton placed on a table, throws it in the air by the vibration which is kept up by the workman, and separates the fibre without at all breaking or injuring it At the same time the wind caused by the sudden vibrations carries off the dust and other impurities After this process the Chinese cotton is particularly pure and soft, and is considered by good judges not to be surpassed by any in the world It is much superior to that imported into China from India, and always commands a higher price in the Chinese market When the last crops are gathered from the cotton fields, the stalks are carried home for fuel Thus, every part of the crop is turned to account the cotton itself clothes them, and affords them the means of supplying themselves with all the necessities of life, the stalks boil their frugal meals, and the ashes even—the remains of all—are strewed over their fields for the purposes of manure But, even before this takes place, the system already noticed, of sowing and planting fresh crops before the removal of those which occupy the land—is already in progress Clover, beans, and other vegetables, are fre-

quently above ground in the cotton fields before the stalks of the latter are removed Thus, the Chinese in the northern provinces lengthen by every means in their power the period of growth and gain as much as they possibly can from the fertility of their land The reader must bear in mind, however, that the soil of this district is a rich deep loam, which is capable of yielding many crops in succession without the aid of a particle of manure Nature has showered her bounties on the inhabitants of this part of the Chinese empire with no sparing hand, the soil is not only the most fertile in China, but the climate is capable of rearing and bringing to perfection many of the productions of the tropics, as well as the whole of those found in all the temperate regions of the globe—(*Fortune's Wanderings*, from page 264 to p 273) The annual importation of cotton into China, has always been very considerable In 1842, there were 650,000 peculs delivered, and in 1843 there were 817,668 peculs, of which 578,775 were Bombay, 89,201 Bengal, 141,860 Madras, and 8,832 American The average is about 750,000 peculs of all kinds at \$7,125,000 The Bombay and Madras cotton trade increased of late years, and that of Bengal decreased, the imports of American are likely to increase The importation of raw cotton into China is, however, on the whole, not likely to increase much under the new tariff, for the cheapness of the manufactured goods will lead the Chinese to take them, instead of working up the raw material Cotton is always quoted in taels and mace in China Prices Current—(*Morrison*)

*Bengal Presidency*—The muslins of Dacca, so long celebrated, have always been manufactured from a cotton grown to the eastward and south east of the city of Dacca, and a few miles inland from the banks of the Burrampooter, the plant was figured by Dr Roxburgh in vol 3, t 269, of his *Coromandel Plants* It has often been doubted whether the superiority of the Dacca manufacture was dependent on the skill of the workmen or the goodness of the cotton, but from Mr Lamb's account, it appears to be carefully cultivated It will probably be found that both have some influence, and it is certain that the workmen prefer the Dacca cotton, because, as Mr Webb long ago explained, its thread does not swell in bleaching, as is the case with the cotton grown in North Western and Central India (Vide Reports of East-India Company on Cotton, p 350)

*North West India Cotton*—Of the cotton which is grown further north, Mr Duncan, as early as 1789, relates, that the greatest part produced in Benares (N lat 25°)

is spun into thread, as the spinners there prefer it of such cotton to the generality of that imported from foreign countries. Of this, the cotton imported from Nagpore was held in the highest estimation and considered nearly equal to that from Surat, though that grown near Benares is described as being very little inferior to it.

*Doab and Bundelcund Cotton* — Dr. Royle, in proceeding down the Jumna in January 1832, observed that the cotton plants on its banks, especially below Agra, though smaller, were very prolific bearers, the bolls were larger, and the cotton better than he had seen either higher up or lower down the river. Subsequently, he was informed that the best cotton was then grown in Bundelcund, in the neighbourhood of Jalow, not far inland from Calpee, that the next was that of Rajahmundry, below Agra. Good cotton is produced all along the banks of the Jumna, as far north as 30°. Mr. Vincent, of Nudjuffpore, stated that in the tract of country lying to the north of Allahabad, "the produce of a begah (one-third of an acre) is, on an average, about a maund of cotton, and two maunds of seed, which is as readily sold as the cotton itself, being an excellent food for cattle."

*Central India Cotton* The cotton of the interior of Central India, whether we consider the opinion of the native manufacturers on the Madras coast, or those of Benares or Bengal, or the exporters at Bombay, has always been highly esteemed. It was bought also at Dacca, and they paid 19 Rupees a maund for the cotton of Siyonge in Malwa at the time that their own cotton was selling for about six Rupees, which was about the same price, as the former was cleaned and the latter uncleaned cotton. The soil of Central India is peculiar, consisting in many places of the black cotton soil, the climate also differs from that of the lower provinces. It is more than probable, therefore, that the causes are physical and may be discovered, which will account for the superiority as well as the facility of culture of cotton in these districts. In such a case, the Delhi Canal affords great facilities and eligible situations. Colonel Colvin introduced the culture of the Upland Georgia cotton into upwards of one hundred villages along its banks.

*Bengal* The Garrow, Tipperah, and Chittagong Hills produce a large quantity of inferior cotton, called Bhoga. It is the principal article of traffic, which the hill people bring down to the plains. The quantity annually sold or bartered by the Garrow tribe is estimated at 50,000 maunds, that by the Tipperah Khasi at 1,00,000, and that by the Chittagong

people at 50,000 maunds, making a total quantity equal to twelve millions of pounds (15 millions, vide Mr. Taylor's letter, 20th November 1849). It is used in the manufacture of the inferior kinds of hummum, bafia, boonee saree, jure, &c., also for making ropes and tapes, and the coarsest of all fabrics, viz. garha and guzeeh, which are commonly used for packing other cloths, and for covering dead bodies, for which purpose a large quantity of them is consumed annually both by hindoos and mahomedans. This branch of industry had not, in 1850, been touched by the rivalry of British manufactures, the thread of which these fabrics are made being far below the lowest number of English yarn imported into Bengal. A piece of Guzeeh cloth, measuring 10 yards, can be purchased for 12 annas (18 pence), which is the one hundred and twenty-fifth part of the price paid for a piece of mulmul khas of the same dimensions — (Dr. Taylor).

*Experiments*, the result of these, in Dharwar, was some satisfaction for the money spent in experiments. Mr. Shaw set the natives agoing in the right way in 1842. He left the country in 1847, and the work went on of itself and increased, and the New Orleans cotton sent from Bombay, is known in Liverpool by the name of 'saw ginned Dharwars,' the price on one day was 9d per lb, while the native cotton grown in the same part of the country was only worth 6½d to 7d.

It would seem, from all inquiries, that Native cotton, though tolerably remunerative to the merchant, is not so to the ryot, and its cultivation is consequently limited. Further that exotic and superior cotton can be grown with equal ease and afford a much higher profit to the ryot, but the competition among the mercantile community has not been such as to lead to a demand, and the native is therefore in want of a stimulus.

The coast districts within a few miles of the sea are likely to prove profitable cotton lands for the growth of a superior staple.

Experiments have been tried on rather a large scale to introduce cotton from all parts of the world, these have been so far successful that 15 varieties of cotton have been introduced, and found to thrive and improve with cultivation, but the ordinary modes followed by the natives do not, ordinarily, prove remunerative.

*Cultivation in America* It is at all times necessary, in deciding on the nature of the soils to be employed for the production of cotton, to consider their suitableness in connection with climate as regards, not only temperature, but humidity. Insufficiency and overabundance of moisture are both inimical to the luxuriant growth of cot-

ton, but of the two the first is by far the worst. Cotton may and in some instances does live through a flood, and yield an abundant crop, but drought, excepting in some peculiar localities and species, destroys it outright while therefore, due care is taken that the soil shall be capable of retaining a great amount of moisture, it is as well, in such soils as are liable to become too moist, by judicious drainage to guard against excessive damp at the roots of the plant. These are subjects to which the native agriculturist pays not the slightest attention, and it is chiefly from such causes that we find the yield of an acre of indigenous cotton but seldom exceeding 500 lbs, the general average being half that amount, while the return from the same quantity of land in America is seldom if ever below 700 lbs, and reaches to double that quantity in some favored situations and peculiarly productive soils. In the cultivation of cotton in America, Mr Spalding considers that a rotation of crops is essential, or rather that an intermediate crop of grain should be reaped, and all root crops be avoided.

For the cultivation of cotton, the ground is well ploughed and cast into ridges, which are about 10 inches in height, but vary in being from 5 to 6 or 7 feet apart, according to the richness of the soil or the kind of cotton to be cultivated. In poorer soils the ridges are narrower, so that the plants which do not grow so large may yet be able to cover the ground. The ridges allow superfluous moisture to be carried off by the water furrow, which in low situations is made into a trench. The soil is allowed to settle for a few days before sowing as the young plants take root more vigorously than when they spring up in freshly ploughed and loose earth. Sometimes the ground is manured by running a deep furrow early in the spring between the old rows of cotton stalks, which are beaten down into it by women and children, who follow the ploughman, or well rotted cotton seed is added as manure, and well covered up by forming a slight ridge over it. When the ground is quite prepared, a one hole drill makes a slight furrow, from  $1\frac{1}{2}$  to 2 inches deep, along the centre of the ridge. The sower follows and drops in the seeds pretty thickly. These are immediately covered by a light harrow, which also smooths the ridge. Sometimes five or six seeds are dropped into holes which are made at intervals of about 15 inches on the top of the ridge. In favorable weather the plants make their appearance in five or six days, and are thinned out as soon as they put forth the third or fourth leaf. This operation is performed by scraping out with the hoe all the superfluous plants and

weeds, leaving three or four together, with spaces of 12 or 14 inches between them. When the plants are sufficiently established, they are reduced to a single one, and care is taken to remove every particle of grass or weed. A light furrow is then run with a one horse plough within five or six inches of the plants, turning the earth inwards towards the roots, and even drawing it around them with the hoe in order to supply the place of that previously removed by scraping. Hoeing and ploughing are frequently repeated, so as to keep the ground free from weeds, and this is considered essential towards obtaining a good crop. The above processes, besides loosening the soil and keeping it clean, must assist in drying it, at the same time that they prevent much lateral extension of the roots.

Lopping or pinching off an inch or two of the top of the plant is not always necessary, but is useful when there is a tendency to the production of wood and leaves, to the detriment of flowers and buds.

*India cultivation* In the cultivation of cotton by the natives of India, the old stocks are pulled up in March, and the land ploughed, 10 bullocks pull one plough, sometimes eight, never less, sometimes old rotten cow-dung is put in the land as manure, generally not so. By the end of May the ground is harrowed by a harrow and a pair of bullocks. After rain has fallen once or twice (about the last week in June) the seed is put in either by a machine with three teeth which scratches the ground and lets the seed fall into the furrow, or else sown broadcast, the seed being mixed with earth to keep the grains separate, it is weeded about four times. The seed is not soaked in water before sowing. The tops of the plants are not cut off—(*Cal Ren No 73 Sept 1861 p 105*)

*Chingleput Cotton Cultivation* Dr J Shortt engaged in the experimental culture of cotton in Chingleput, for three or four years, and with good success. The samples grown by him gained the gold medal awarded by the Manchester Cotton Supply Association, and the details of the experiments, the prize of Rs 1000, and the gold medal of the Agri Horticultural Society of India, also the medal of the London Exhibition. The varieties of cotton that seem to succeed without irrigation at Chingleput, are Bourbon, New Orleans and Brazil, and these continue to flower and fruit crop after crop. The Bourbon in particular, continues to produce throughout the year. (*Suggestions for the cultivation of Cotton*)

*Preparing the land*—This should be well ploughed two or three times, and the deeper the better. All the weeds should be collected into heaps on the ploughed land and burnt,

as the ashes make the best manure for cotton and burning the soil improves its quality. Salt and lime are also good additions to a soil—as cotton requires chiefly alkalis and silicates for its nourishment. Both animal and vegetable manures are injurious, as they breed insects which destroy the roots, leaves, and young pods of the cotton.

*Sowing the seed*—After the land has been well and deeply ploughed, it should be left for three or four days to let well aired, it may again be ploughed into long ridges four to five feet apart. The seed is to be planted on the tops of these ridges carefully, at the depth of an inch or two, and at the distance of five feet between each seed for Oopum, Nankin or Religious cotton, six to seven feet apart for Bourbon, New Orleans or Havannah, ten feet apart for Sea Island, Peruvian, Egyptian or Queensland—and fifteen feet apart for Brazil or Pernambuco cotton. Cotton seed may be sown in any month of the year, and if there is no rain, it requires to be watered about three times, it germinates about the fifth day. If sown during the monsoon, the ridges must be eight inches high and the water must be led away from the young plants or they rot, the seed must be sown on the top of the ridges. If the leaves begin to get pale or to shrivel up, the remedy is to dig trenches between the plants so as to let an in about the roots, but do not injure them.

*Treatment of the young plants*—When left without cultivation, the cotton plant lives for three or four years, but it becomes dwarfed and produces smaller leaves and smaller pods each year till it dies. In clay or cotton soils the plants do not attain nearly the size, nor do they produce such fine leaves or pods as on sandy or loose soils. The cotton plants require sun, air, and moisture, but not so much of the last as of sun, light and air at the roots, the lighter and looser the soil the more healthy is the plant. The best soil for cotton is a sandy soil with iron and salt, or if far from the sea, ashes of plants or of fire wood may be used as a substitute for salt. When the cotton plants have attained the height of a foot they do not require to be much watered, once in ten days will be sufficient.

*Height of the trees and their relative size*—Oopum or the common country cotton varies from one to six feet in height, and covers from two to five feet of ground, on cotton soils it seldom grows to more than two feet in height. Most of the other varieties of cotton grow to a height of six or seven feet. The Pernambuco and Brazil cottons attain a height of thirty feet on favorable loose soils, and the stem grows to ten inches in diameter,—

they yield crops for twelve or fourteen years, but hardly any produce the first year. They bend over in the second year, and do not afterwards stand higher than eight or nine feet.

*Relative produce*—In India some of the cotton soils yield only 30lbs of Oopum cotton per acre including seed and cotton. In sandy soils near the sea this cotton has been known to produce 260lbs of seed and cotton per acre. In America, the produce per acre is estimated good at 230lbs of clean cotton per acre, the proportion of seed is about four times the weight of cotton—but this depends upon the amount of labour bestowed on the soil. Garden culture of small tracts of land is thought to pay much better than large half tilled acres of waste land. Cotton ought to yield two crops in a year, the first within the four or five months after the seed is put in. If weeds or other plants grow up along with cotton they spoil and choke it, besides breeding insects about it which destroy the young pods.

*In the Travancore Cotton Experiments*, by His Highness Rama Varma 1st Prince of Travancore in 1863, the seed of Pernambuco cotton was sown in the end of July, and in August, when the plants had four or five leaves on them, they were transplanted into pits a foot and a quarter in depth, three feet in diameter and fifteen feet apart. The pits were filled with red soil and a little manure, and the plants were occasionally watered—and weeds and sea leaves removed. The first flowers appeared in November, but most of these fell off. The first leaves were large and healthy, the second wrinkled and contracted, and the roots of the plants infested by ants. The application of a mixture of ashes, salt, and quicklime removed the ants. The picking commenced in January 1864, each plant produced on an average 35 pods. The leaf cases of many of the young fruits gave shelter to little spiders, and this is perhaps one of the reasons why some of the pods perished.

The specimens of cotton forwarded were very clean, long in the staple, of good colour, but coarser than Bourbon or Sea Island. The seeds large, full, black, and connected as in the Brazil and Pernambuco varieties, cotton easily separated from the seed.

In Assam, *irrigation* is considered generally unnecessary, though it may be found partially beneficial in dry and sandy soils if judiciously applied. *Irrigation* is not resorted to in the Benares, Allahabad, and Jubbulpore Divisions, and the feeling is against its employment.

In some other parts of the North-Western

Provinces the cotton crop is invariably irrigated where a want of rain is found to be likely to prove detrimental to the plant, and the process is not supposed to be in any way injurious to the fibre.

In most parts of the Madras Presidency artificial irrigation is not carried on, this remark applies more particularly to Coimbatore, Madura, South Arcot, Bellary, Western Mysore, and Nellore. In Vizagapatam, on the other hand, the opinion is, that irrigation would prove beneficial rather than injurious in seasons when rains fail or vary in their supply.

Artificial irrigation is almost unknown in the Bombay Presidency, the Collectors of Sholapore, Ahmednuggur, Belgaum, and Kana, consider it injurious. The Collector of Ahmedabad thinks that occasional floodings at seasonable periods during the growth of the crop would be beneficial, and the Collector of Dharwar adds, that it has been determined by experiment that cotton can, by judicious management, be irrigated with success both in black and other soils. Mr Inverarity, Collector of Broach, was decidedly of opinion that artificial irrigation is not only injurious to the growth of the cotton plant in that collectorate, but tended to weaken the wool. The succeeding collector, (Mr Tucker) who had never heard of irrigation of indigenous kinds of cotton in black soil, of which the district of Broach is principally composed, states that it has proved successful with exotic varieties, and that if it were tried with the former species the prejudice might prove to be unfounded.

In both North and South Berar artificial irrigation is unknown.

The same remark applies generally to the Tenasserim and Maitaban Provinces, Rangoon, Bassein and Pegu.

In some parts of the Punjab, cotton is generally irrigated from wells, and this has never been considered injurious, well water is considered better for the purpose than river or canal water. In other parts, more especially in the Jullundur Doab, the best cotton is produced upon unirrigated lands, irrigation being very sparingly resorted to in tracts where water is abundant.

From the perusal of this summary, it appears that artificial irrigation to cotton is rather the exception than the rule in most parts of India, that it proves more serviceable to exotic than to indigenous kinds that in heavy black soil cotton will seldom flourish under irrigation, even of the most careful kind, while in sandy and light red sorts it might be much benefited.

*The Cotton Planter's Manual* mentions that *salt marsh mud* is used for manure in various parts of the cotton growing districts of the United States, more especially in Edisto Island, one of the largest of the South Carolina Group, about 30 miles south-west of Charleston which yields the finest cotton in the world. As much as 40 cart-loads of this mud is used to the acre. Some compost it, others put it in the cattle pens. Some dry it before hauling, and then spread upon the land, while others prefer to use it as soon as dug, spread upon the land wet, and ploughed in. It is supposed that the Sea-Island qualities owe their superiority to the use of marsh mud, which is rich in alkalies and alkaline salts.

*Tenasserim Province*—Mr Blundell introduced the Pernambuco cotton plant, *Gossypium acuminatum*, which produces the Pernambuco, Peruvian, Bahia, or South Sea Island cotton, and Capt Macfarquhar raised such a fine article at Tavoy from it, that the committee of the Agricultural and Horticultural Society of Calcutta were unwilling to believe it the production of that species. They reported that "the sample sent by Capt Macfarquhar appears to be of a quality resembling the Sea Island, but finer and more silky, and the fibre not so strong, its value is not so easy to determine but the Committee are of opinion that it would sell for a high price. The Pernambuco cotton, which, it is believed, is the same as the South Sea Island cotton is an inferior staple to that of the North American Sea Island, and they have a sample of cotton submitted which in point of fineness surpasses the genuine Sea Island cotton of North America. This improvement on the general staple of Pernambuco cotton might be reconciled, had it been produced at a distance from the sea, since it has been ascertained, that this description of cotton deteriorates by proximity to the sea, whence your Committee are disposed to think that Capt Macfarquhar has been led into error in calling it South Sea Island instead of Sea Island." Admitting that Captain Macfarquhar was in error, which it is believed he was not, the report proves that an article "finer and more silky" than the best American cotton, has been raised in the Tenasserim Provinces. The principal difficulty to the introduction of this species into general cultivation was, as Mr Blundell told Dr. Mason, that the trees did not produce abundantly.—*Mason*.

*Sea Island Cotton* Sea Island cotton has been raised in the Tenasserim Provinces by amateur cultivators, but Mr Mason had never seen any report on the article obtained.

"*Bourbon cotton* of Indian growth," says Wight, "has sold in the London markets for the highest prices going," and, as the *Bourbon* plant is the original *Sea Island* acclimatized to the East, the cultivator would have a stronger probability of success by obtaining his seed from *Bourbon*, than from *America*. Much attention should also be given to the selection of a proper soil. Analysis has shown that all the lands on which cotton is grown in India, differ widely in their constituent parts from the best cotton land of *America*. The subject is still in its infancy, more extensive analysis being required, "but it seems at present," observes Mr Piddington, "that the abundance and fineness of good cotton depend on the quantity of carbon in the soil, and the solubility of that carbon. If, therefore, you can obtain a soil approaching the *American* soils, that is, containing perty matter, lignte, and colouring cold water, this will no doubt be the best, because it contains carbon, and probably by drogen combined with it, suitable for the food of the plant. And the next best soil is one containing carbonate of lime." The varieties are *Gossypium barbadense* Var (a) *Barbadoes*, or *Bourbon cotton* (b) *Sea Island*, or long stapled (c) *Upland Georgia*, or short stapled.

The *Karens* usually grow cotton enough to make their own fabrics, and on the *Salween* and *Tenasserim*, it is sometimes raised in considerable quantities, but its market price is little more than a fourth of the best *American cotton*, yet with improved modes of culture, and frequent changes of seed, its value would undoubtedly be greatly increased — *Mason*

*Bombay Presidency* — The *Bombay Presidency* has long exported large quantities of cotton both to *Europe* and *China*. The best cotton districts are the southern *Mahratta* country, about 16° N lat., where the experimental farms were established *Guzerat* and *Kattywar* are districts where superior cottons are grown by the natives, in consequence of which, these were selected as the sites of the northern experimental farms, and much favourable land for the purpose is found between the latitudes of 21° and 24° North. This part of the country was the site of the experiment of Assistant Surgeon Gilders in 1816-17 who, having observed the causes which led to the failure in the attempt to introduce the cultivation of *Bourbon cotton* into the western districts, considered the obstacles to have been exclusively of a physical nature. He at the same time stated, that both the soil and climate of the districts lying between the *Subermuttee* and the *Myhee* promised a favourable result. The cotton grown, and that time, by Mr Gilders

was considered at *Bombay* fully equal to any produced in *Bourbon*, and, in *London*, as the best specimen that had been imported from *Bombay* raised from *Bourbon* seed. It sold for 15d per lb. With so much sagacity had Mr Gilders selected the site of his experiments, that fifteen years afterwards Dr Burns collected seed from trees growing apparently wild. These being sown, produced plants of which the cotton was pronounced equal to the best from *New Orleans*. The cotton grown at *Labeikowa*, within two miles of *Mongiole*, though confined to a space of 200 beegahs, or thereabouts, was so highly valued, that on the spot it would fetch six-sevenths of a rupee per maund more than any other kind in that part of the country, yet the natives say they frequently used seed from *Guzerat*, or any part of the country. The superiority must, therefore, depend either upon peculiarity of soil and climate or excellency of culture. One point only of the latter is related, but that is one of great consequence. For instance, the people are in the habit of carefully extracting the cotton alone from the pod in the field, and this is, probably, of considerable importance, as some of the *American* planters are of opinion, that the staple of *Indian cotton* is much injured after it is collected by being allowed to heat when piled up, often for a long time before it is cleaned.

*Madras Presidency* — As early as 1790, Dr Anderson was employed in sending *Mauritius* cotton seeds as well as "*Brown Cotton Seeds*," imported from *Malta*, to different parts of the peninsula, and Dr Roxburgh, who left *Samulcotta* in the *Northern Circars* and took charge of the *Calcutta Botanic Garden* in 1793, had already ascertained that the elevated, dry, and less fertile soil of *Coromandel* was better suited than that of *Bengal* to the *Bourbon cotton*. He obtained them from Mr Hughes, who had for some time been engaged in the culture of cotton in the *Tinnevely* district, and whose success was so considerable with *Bourbon cotton*, that for twenty years "*Hughes' Tinnevely Cotton*" continued to be quoted in the *Liverpool* market as the best from *India*, and sold at higher prices than the *American* sort staple cottons, and 3d per lb above the best *Surats*. The fact is important, on account of the latitude of *Tinnevely* being only 8½°, and because the success was evidently the result of skill applied to the culture. The produce, only 100 lbs per acre, was fine in quality and much esteemed. It would also seem that in *Vizagapatam*, about North latitude 17°, the return is much greater than in any other district, as the produce is said to amount to "forty-six maunds, or 115 lbs, of seed cotton per acre, nearly equal to the best,

and exceeding the ordinary American crops." The culture here is peculiar, as very liberal pruning is practised. In Trichinopoly, with a fertile soil, 83 lbs, which is the next highest, is the greatest return, which, though so much less than the above, is still more than double the average return from other districts. The cotton of Central India finds its way to Bombay. The causes which favour the growth of cotton, esteemed both in India and England, in the tract of country extending from Surat and Ahmedabad, or from about lat 21° and 23°, in a broad band across Malwa to Banda and Rajahmundry, in about 25° and 27°, near the banks of the Jumna, are no doubt physical. The black cotton soil which is spread over a great portion of this tract has undoubtedly a considerable share in producing the effect, but good crops of cotton are produced in some parts where there is no black soil, as immediately on the banks of the Jumna and in the Doab. It will therefore probably be found, that the comparative dryness of the climate after the plant has got well established in the ground checks the vegetative vigour, and favours the production of prolific fruit.—*Royle's Productive Resources of India*

Dr. R. F. Thompson of Hoogly, writing in 1870, says that not less than 378,000 acres are under cultivation for cotton in Dharwar at one time. The stem of the cotton shrub, he says, yields a fibre, which can be extracted as in the manufacture of jute, and when cleaned has the appearance of a middling quality of that article. It has neither the colour nor value of fine jute, but the gunny made from it is valued at Rs 4-8 per maund. Computing the fibre as worth one rupee per maund, he estimates the loss from throwing away the stalks, at not less than Rs 22,68,000 in Dharwar alone. After extracting the fibre, the refuse can be burned into an ash. (*Madras Times*, 13th Dec 1870.) Cotton plants are mucilaginous and have been used as demulcents. The seeds yield oil, which is sometimes expressed for burning in lamps. Cattle are, however, often fed on the seeds, which are also sometimes employed as manure for cotton plants. Cotton wool is largely employed, throughout the world, in the manufacture of cloths. Cotton has been long a popular application to burns. Dr Anderson (Ed M and S Jouin 1828) directs it to be applied in thin layers, one over the other, and retained by the moderate pressure of a bandage. Pain is allayed, local irritation and blistering diminished or prevented, and constitutional disturbance proportionally obviated. M. Reynaud adopted its application in case of erysipelas, and M. Mayor employs

it as a topical application with calomel in cases of ophthalmia (B and F Med Rev xx. 463). Cotton, though used chiefly for clothing, is, in India, also employed to a considerable extent for cordage, as, for instance, for tent ropes, which are made entirely of cotton, as are the tents themselves. Cotton ropes are also employed for many domestic purposes. Specimens were sent to the Exhibition of 1851, both from Calcutta and Madras, and have considerable strength. Some of the native shipping, also, and even a few American ships, are rigged with cotton ropes, while cotton canvas is also employed for sails, especially on the coast of Cutch, where some very good rope is made, and which sells for about three and a half annas per yard.—*Agri Horticultural Societies of India and of Madras*, C. Bimahai	Hand	Pahma	of BUNDLUND
Pkai	of Doab	Potree	of DELHI

COTTON GOODS are both imported and exported, also cotton twist and yarn. Between the years 1850-1 and 1868-9 the quantities imported of cotton twist and yarn have ranged from lbs 16,892,073 as in 1865-6, to lbs 29,519,238 in 1853-4, and almost the same quantity in 1868-9 but the declared value has almost doubled since 1853-1854

Year	lbs	£
1853-4	29,519,238	1,306,913
1868-9	29,042,052	2,779,934

Cotton goods have been imported to a greatly increased extent, from £364,361 in 1850-1 to £16,072,551 in 1868-9. The

value of the exports of cotton goods, cotton twist and yarn, has doubled in the twenty years, but re exports are not distinguished

Year	Imports		Exports Cotton Goods including twist and yarn, both country and foreign, value, £
	Twist quantity, lbs	Yarn value £	
1850-51		1,039,329	3,647,361

**COTTON MANUFACTURES** Amongst the goods which appear to have been brought to Europe from the Indian seas, in the days when Aah traders were the only medium of intercourse between the eastern and western worlds, we find mentioned cloths of silk and cotton of various colours and devices. It does not appear, however, that there existed any great demand for cotton, the consumption of the Roman people, who were then the customers for all luxuries, being chiefly confined to cloths of silk and wool. During the early trade of Europeans with India by the long sea route, the calicoes and fine muslins of that country came first into general notice, and from that date until the production of machine-made fabrics in England, they continued to rise in public estimation. It was deemed a great thing with the Lancashire manufacturers, when, by the aid of mechanical and artistic skill combined with the potent agency of steam, they found themselves able to produce an article which was considered equal to that which the unlettered Hindoo had manipulated in his little mud hut on the remote banks of the Ganges, and which had been produced of like excellence by their ancestors, when the "father of history" penned his observations upon their countries. That the Hindoos paid considerable attention to the details of this manufacture in the most remote ages there remains sufficient proof on record. In the Indian work of highest antiquity, the Rig Veda, believed to have been written fifteen centuries previous to our era, occurs the following passage, "Cares consume me, Satakratu although thy worshipper as a rat gnaws a weaver's threads"—the temptation to the rat was evidently the

starch employed by the spinner to impart tenacity to the thread, nor can there be any doubt that cotton was the thread alluded to. Again, in Menu, we find it directed as follows "Let the weaver who has received ten palas of cotton thread, give them back increased to eleven by the rice water (starch), and the like used in weaving, he who does otherwise shall pay a fine of twelve panas." The cotton fabrics of India formed a considerable item in the exports from the East to this country during the early days of British Indian commerce, the delicacy of their fabric, the elegance of their design, and the brilliancy of their colours, rendered them as attractive to the better classes of consumers in Great Britain as are, in the present day, the shawls of Cashmere or the silks of Lyons. So much superior indeed were the productions of the Indian spinning-wheel and hand loom, to those turned out by the manufactures of Lancashire in the middle of the last century, that not only were Indian calicoes and Indian prints preferred to the home-made articles, but the Manchester and Blackburn weavers actually imported Indian yarns in large quantities for employment in their factories. It was about the year 1771-2 that the Blackburn weavers, taking advantage of the recent discoveries and improvements of Arkwright, Hargreaves and others found themselves in a position to produce plain cotton goods, which, if they did not quite equal the fabrics of the East, at any rate found their way very rapidly into general consumption in Europe. The invention of the mule jenny, in 1779, was the commencement of a new era in the history of the cotton manufacture of Great Britain, and when, six years later, Arkwright's machines were thrown open to the public, a revolution was effected in the production of all kinds of yarns, England found herself able, not only to supply all her own wants with cotton goods of every variety of quality, but also to carry the produce of her looms ten thousand miles across the sea, and placing them at the doors of the Indian consumer, undersell the goods made by his own hands from cotton grown in his own garden. Nor is it only in the heavier goods that the West are able to beat out of their own markets the weaver of the East. There have long been masters in their craft who can and do produce fabrics more exquisitely delicate and light in texture than those beautiful muslins of Dacca, so long and justly celebrated with a world wide fame, and although in some particular these latter fabrics still claim a certain degree of superiority, and although many of the Hindoos prefer their own woven goods to those of Manchester and Glasgow, the cot-

ton manufacture of British India, in spite of its supply of the raw material growing often close to its door, in spite of labour absurdly cheap, may truly be said to have ceased in favour of the far off industry of Lancashire and Scotland. The actual result of this revolution of half a century has been that, in place of Britain importing cotton goods and yarns from the East to the yearly value of about 800,000*l*, that country is able, in the present day, to ship to the various ports of India cotton fabrics to the value of upwards of three millions sterling. The decay of this branch of British Indian exports has been steady and continuous. In 1827-8, Bengal shipped but to the value of 275,000*l*, in 1837-8, not more than 69,000*l*, and at the present moment our supplies from the East are limited to about five thousand bales from Madras, solely for re-shipment to our western colonies, and various parts of northern and western Africa. Dacca was the seat of manufacture of the muslins known by that name, and spoken of by the ancients as "woven webs of hair." The most delicately worked and highly ornamented scarfs and dresses are wrought at Delhi, Benares, and Ahmedabad. Haripaul and Santipore, whilst the more substantial and useful fabrics were wrought chiefly at Patna, Luckpoore, Lucknow, Balasore, Masulipatam, Cuddalore, and Surat—*Royle, Arts of India*. Of the arts practised at Dacca, the first that claims attention is the Cotton Manufacture. In a commercial point of view, this is no longer the important branch of industry that it formerly was, but, regarded as an art which furnishes exquisite specimens of textile fabrics, it is still unrivalled. The implement used in spinning and weaving indeed is rude but the simplicity of its construction contrasts with the delicate gossamer texture of the fabrics made by means of it, and shews that the skill displayed in this manufacture is less the result of artistic ingenuity or complicated mechanical appliances than of that dexterous use of the hand and foot, and delicacy of touch which are possessed, in so remarkable a degree, by the hindoo artisans of Bengal. With their rude implements the hindoos of Dacca succeed in manufacturing muslins, "to which," as Dr Ure observes, "European ingenuity can afford no parallel, such indeed as has led a competent judge to say, it is beyond his conception how this yarn, greatly finer than the highest number made in England, can be spun by the distaff and spindle, or woven by any machinery" (*Ure's Cotton Manufacture of Great Britain*, Vol I, p 54). There is the primitive instrument used for carding the fibres of the cotton, likewise the instruments employed

for separating the wool from the seeds, and for bowing or teasing the former. The first is simple—the jaw bone of the boalee fish (*Silurus boalis*), the teeth of which being fine, recurved and closely set, acts as a fine comb in removing minute particles of earthy and vegetable matter from the cotton. The hindoo spinner, with that inexhaustible patience that characterizes her race, sits down to the laborious task of cleaning with this instrument the fibres of each seed of cotton. Having accomplished this, she then separates the wool from the seeds by means of a small iron roller (dullun kathee) which is worked with the hands, backward and forward, on a small quantity of the cotton seeds placed upon a flat board. The cotton is next hewed with a small bow of bamboo strung with a double row of catgut, muga silk, or the fibres of the plantain tree twisted together, and having been reduced by this instrument to a state of light downy fleece, it is made up into a small cylindrical roll (puni) which is held in the hand during the process of spinning. The spinning apparatus is contained in a small basket or tray not unlike the cathetere of the ancient Greeks. It consists of a delicate iron spindle (tukona), having a small ball of clay attached to it in order to give it sufficient weight in turning, and of a piece of hard shell imbedded in a little clay on which the point of the spindle revolves during the process of spinning. With this instrument the hindoo women almost rival Arachne's fabled skill in spinning. The thread which they make with it is exquisitely fine, and doubtless it is to their delicate organization and the sensibility with which they are endowed by nature, that their mimtable skill in their art is to be ascribed. The finest thread is spun early in the morning before the rising sun dissipates the dew on the grass, for such is the tenacity of its fibre, that it would break if an attempt were made to manufacture it during a drier and warmer portion of the day. The cohesive property of the filaments of cotton is impaired by high temperature accompanied with dryness of the air, and hence, when there is no dew on the ground in the morning to indicate the presence of moisture in the atmosphere, the spinners impart the requisite degree of humidity to the cotton, by making the thread over a shallow vessel of water. Skeins of fine thread of different qualities, with a memorandum of the length, weight, and time occupied in spinning, attached to each skein should be submitted for exhibition. A specimen which Dr Taylor examined at Dacca in 1846, measured 1,349 yards, and weighed only 22 grains, which is in the proportion of upwards of 250 miles to a pound weight of sta-

ple During the process of preparing the thread, and before it is warped, it is steeped for a couple of days in fine charcoal powder soot, or lampblack mixed with water, and after being well rinsed in clear water, wrung out, and dried in the shade, it is rubbed with a sizing made of parched rice, (the husk of which has been removed by heated sand) fine lime and water. The loom is light and portable, its cloth and yarn beams, batten, templet and shuttle, are the appurtenances requisite for weaving. The principal varieties of plain muslins manufactured at Dacca, were Mul mul-i-Khas, Ab-ruwan, Shub num Khasu, Jhuna, Circar Ali, Tunzeb, Alabullee, Nyuzook, Buddun Khas, Turundum, Surbutee, and Surbund—names which either denote fineness, beauty or transparency of texture, or refer to the origin of the manufacture of the fabrics, or the uses to which they are applied as articles of dress. The finest of all is the Mulmul-i-Khas, (literally muslin made for the special use of a prince or great personage) It is woven in half pieces, measuring 10 yards in length, and 1 yard in breadth, having 1,900 threads in the warp, and weighing 10 Siccas, (about  $3\frac{1}{4}$  ounces Avoirdupois) The finest half piece seen weighed 9 Siccas. The price is 100 Rupees. Some of the other muslins are also beautiful productions of the loom, as ab ruwan, compared by the natives from its clear pellucid texture to "running water." Shub num, so named from its resemblance when it is wetted and spread upon the bleaching field to the "evening dew" on the grass. Jhuna, a light, transparent net-like fabric, usually made to order, and chiefly for natives of rank and wealth, worn by the inmates of zenanas and dancers, and apparently the cloth referred to in the Classics under the figurative names of Tela arenarum, Ventus textilis. All these muslins are made in full pieces of 20 yards in length by 1 in breadth, but varying considerably in the number of threads in the warp, and consequently in their weight. Of figured fabrics, as striped (Dooree), chequered (Charkanee), and flowered (Jamdannee), there exists a considerable variety, both in regard to quality and pattern. The flowered muslin was formerly in great demand both in India and Europe, and was the most expensive manufacture of the Dacca "Uring." There was a monopoly of the finer fabrics for the Court of Delhi those made for the emperor Aurungzebe cost 250 Rupees per piece. This muslin is still much admired, but is now seldom manufactured of a quality of higher value than 80 Rupees per piece. Omitting the second-rate kinds of cloth, as Saree, Boonee, Bafta, Joru, Ekpatti, Gamchar, &c, now entirely made of English yarn im-

ported into the district, and which constitute the great bulk of the Dacca cotton manufacture, the next class worthy of attention is that of fabrics of a mixed texture of cotton and silk. They are designated by various names, as Nowbuttee, Kutun, Roomee Apjoola and Lucka, and when embroidered with the needle as many of them frequently are, they are called Kusheeda. The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet, but the cotton thread employed is now almost entirely English yarn, of qualities varying from No 30 to 80. These cloths are made exclusively for the Jedda and Bussora market, and a considerable stock is yearly imported in the Arab vessels that trade between Calcutta and these ports. Pilgrims too from the vicinity of Dacca not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meena, near Mecca. They are used by the Arabs chiefly for turbans and gowns. The golden color of the muga silk gives to some of these a rich lustrous appearance. Pieces, made of native spun cotton thread, and of the best kind of muga silk, would be admired in England—(*Dr Taylor*) The export trade of the Madras Presidency in madapollams and long cloths has been annihilated by the goods laid down by the British manufacturer, in all the bazars of India. The export-trade of what were denominated madapollams and punjums for the 10 years from 1815-16 to 1824-25 was as follows—

	Bales	Pieces	Value Rs.
1815-16	11,925		37,82,859
1816-17	10,243		33,53,213
1817-18	9,905		32,78,330
1818-19	7,715		24,00,543
1819-20	5,903		19,64,006
1820-21	5,149		16,81,551
1821-22	2,915		12,53,383
1822-23	541	53,220	409,337
1823-24	"	142,470	793,208
1824-25	"	128,460	802,600

This description of goods is not now made, and pieces of punjum are only interesting as specimens of that important manufacture which formerly was to be found in bales in the bazar and in the Custom House for shipment. The same causes which have contributed to a general falling off in the cotton manufacture of the Madras Presidency, produce a like change upon the yarns spun by hand, and the change may be perceived by referring to the quantities of cotton twist imported from the United Kingdom in the years from 1826 to 1830, compared with the 10 years 1844 to 1853.

1826-27	13,296	1829-30	49 1 10

1848 49	375 250		
1849 50	673,387	Total	84,23 944

It is, however, worthy of remark that even the skill and capital of Great Britain has not been able to compete in a certain class of fabrics with the manufactures of the Madras Presidency in the home market, or even to exclude them from the foreign. This does not arise from any distaste upon the part of natives to wear articles of European manufacture, but consequent upon Europe not being able to supply a white or dyed article, usually worn by natives, as cheap as it can be manufactured in the country, proving that there are bounds even to the power loom, and that fabrics coarse in quality can still be made by the hand at a profit, for, after a fair trial the weavers of Europe have given up competition in this description (Native Cloths) of fabrics finding their exportation to India not remunerative.

It is generally supposed that the power looms of Britain have destroyed the export trade of Madras, but the annexed table demonstrates that such is not really the case, for though a certain description of goods have ceased to be exported yet on the whole there is no very extraordinary difference in value between the export of Cotton Piece Goods, in what were considered the palmy days of the Export Trade, compared with those of the last ten years.

1844-45	3,841 982	1849 50	3,097,559
1845-46	3,926,438	1850 51	2 942,874
1846-47	4,286,921	1851-52	2,908,934
1847-48	3 736 055	1852-53	3,521,516
1848-49	2,843 425	1853 54	3,141,024

The cotton twist imported from the United Kingdom may in round numbers be taken at 400 bales per annum, each bale will make about 3000 yards of the native cloths usually worn, which would give 12 000 000 (twelve million) yards annually manufactured, irrespective of goods made by yarn spun by the hand. The amount thus given is an estimate that approximates to the truth with sufficient accuracy to exhibit the great extent to which handloom weaving is still carried on in this Presidency. In Ganjam is fabricated a cotton cloth, each side of a different color. This effect is produced not by dyeing

the cloth after it is woven, but by a dexterous manner of throwing the wool across the warp on either side. Madapollum and Ingerim used to be famous for cotton cloths, but since the abolition of the Company's trade, the finer muslins have not been made. Palampores, as bed coverings, of the former place deserve attention. Very fine muslins are made at Oopada, North of Coconadi, and handsome turbands, with gold thread interwoven—but all these things are far surpassed by the Bengal fabrics. The Chiclee Muslins are however prized by ladies. Cotton cloths from Nellore consist of manufactured articles which find a ready sale in the markets of this Presidency.—*Madras Exhibition Juries Reports*, 1855, 1857. *Dr Taylor of Dacca, in Reports of Great London Exhibition of 1851*. *Calcutta Catalogue of London Exhibition of 1862*. *Report of Juries of Exhibition of 1862*. *Dr Royle Arts of India*, *Dr Royle Productive Resources of India*.

**COTTON-GRASS** *Eriophorum cannabinum*. Its seeds are clothed at their base with a silky or cotton like substance with which pillows are stuffed and wicks of candles, as well paper made. Its name is bhahur and bhahmice, and it is made into ropes by the Indians. "The wild trees of that country bear fleeces as their fruit, surpassing those of sheep in beauty excellence, and the Indians use cloth made from those trees."

**COTTON PLANT** *Gossypium Indicum*, *Lam*.

**COTTON ROPES** are in general used in India, especially for tents. They are strong, but liable to stretch.

#### COTTON SEEDS

Cappasin	Guz Hind	Pala vittulu	TEL.
Punjiverai	TAM		

Are chiefly used in India for feeding cattle, and also sometimes as manure for cotton plants.

**COTTON SEED OIL** An oil is expressed from cotton seeds which is used for burning in lamps, and is also considered to have, in a peculiar manner, the virtue when externally applied, of clearing the skin of spots and freckles.—*Faulkner*.

**COTTON, SILK.** The silk cotton trees belong to the natural family of Byttneriaceæ, and genera of Bombax. The species of Bombax are remarkable for their gigantic stature and their splendid inflorescence, also on account of their capsules, which on bursting, display a flocculent cotton-like substance, and the tree is hence called cotton tree. But this substance being more silky than cotton, it has been named silk cotton. It differs also in not spinning like cotton. Some

difficulty, therefore, is experienced in making use of this very abundant cotton-like produce, but Mr Williams, of Jubbulpore, succeeded in spinning and weaving some of it, so as to form a very good coverlet. It is used for stuffing pillows, muffs, and coverlets, for wadding, or for conversion into half stuff for paper-makers, perhaps for making gun-cotton. In the 'Trans of the Agri-Hortie Soc,' in p 274, there is a report from the Society of Arts on two pieces of cloth made from the Smool or Silk Cotton tree, and it is observed that, from the shortness of the staple of the down, and its elasticity, it could not be spun by ordinary cotton spinning machinery. — *Roy's Fib Plants*

COTTON TREE *Eriodendron anfractuosum*

COTTON, General Sir Willoughby, G C B and K C B, died on May, 1848—at his residence in Lowndessquare. Sir W Cotton, like his kinsman Field Marshal Viscount Combermere, achieved an honourable career in the British army, his services having extended over a period of upwards of 60 years. He was the only son of Admiral Cotton, cousin of Lord Combermere, and a nephew of Sir Willoughby Aston Willoughby, and was born in 1783. When in his 16th year he left Rugby school to enter the 3rd Guards as ensign. In 1805 he accompanied his regiment in the expedition to Hanover. After his return from Germany he was, in 1807, engaged with his regiment in the expedition to Copenhagen, where he was appointed deputy assistant-adjutant-general to the reserve, under the Duke of Wellington, and was present at the battle of Kioge. In 1809, he accompanied the duke to Spain, and served as deputy assistant-adjutant-general to the Light Division during the whole of the campaign of the retreat to Torres Vedras, and the subsequent advance, the former containing a series of skirmishes, and the battle of Coa, under General Crawford. In 1811 he returned home on promotion, but rejoined the army in the Peninsula in 1813, and served until the close of the war. He was present at the battle of Vittoria, commanded the light companies at the passage of the Adour, and the pickets of the 2nd Brigade of Guards at the repulse of the sortie of Bayonne, besides other engagements of minor importance. He received the war medal and three clasps for Busaco, Vittoria, and Nive. In India he commanded a division of Sir Archibald Campbell's army in the Burmese war. He commanded the 1st division of the Bengal army in the Afghan war in 1838-39, under general Sir Henry

Fane, and afterwards under general Sir John Keane, in which army were many names illustrious in the military annals of British India, Nott, Denmie, Sale, Willshire, Wheeler, Outram, and Havelock. He was present at the storming and capture of Ghuznee on the 23rd of July, 1839, at which he commanded the reserve which entered the city after the storming party had established themselves inside. His name was honorably mentioned in the despatches of Sir John Keane, and in those of the Governor General, Lord Auckland. In October 1839, he relinquished the command of the Bengal forces, then in camp near Cabul, to assume a command in the Bengal Presidency. He was from 1847 to 1850 Commander-in-chief at Bombay, and was second member of council in that Presidency. He received the Order of the Bath of all the grades, being nominated a Grand Cross of that Order in 1840. He was made a Knight Commander of the Royal Hanoverian Guelphic Order in 1830, and had conferred upon him the Order of the Dournee Empire of the 1st class at Cabul, in September 1839. — *Men of the Time*

COTTUS. A genus of Fishes belonging to the section Acanthopterygii and family Loricati, *Jenyns — Eng Cyc p 147*. See Fishes

COTULA ALBA LINN Syn. of *Eclipta erecta*, Linn

COTUM BARRU SING Coriander seed

COTURNIX, a genus of birds, of the order Rasores, 4 species of which occur in India. *Coturnix vulgaris*, the common quail of Europe, Asia, Africa, is chiefly migratory and is abundant in India, though M Gould considers the race of this country to be distinct. See Birds

COUNTRY A word in use amongst the British in India, prefixed to other words, to indicate a product of India. It is a translation of several vernacular words, used to express an article local and not foreign. The Tamil word "Nat" has this signification.

COUNTRY ALMOND TREE ENG *Terminalia catappa*

COUTEAUX Fr Knives.

COUVADE, custom amongst several ancient tribes Marco Polo mentions that in the Zar-dandan (gold teeth) tribe, on the frontiers of Burmah, when a woman bore a child, she rose and went about her business, and the husband took to bed for forty days, and was fed on possets A Greek epic treats entirely on the same subject, as customary amongst a people on the Euxine

In the Tibarenn Land,

When some good woman bears her lord a babe,  
'Tis he is swathed and groaning put to bed,  
Whilst she arises, tends his bath, and serves  
Nice possets for her husband in the straw

Marco Polo in the thirteenth century seems to have observed the custom in the Chinese province of West Yunan amongst the aboriginal tribes of the land, the Miautze, who practice it to the present day The father of the new born child, so soon as the mother can leave her couch, gets into bed and there receives the congratulations of acquaintances About the beginning of the christian era, Strabo (in 4,17) mentions that among the Iberians of the north of Spain the women after the birth of a child, tend their husbands putting them to bed, instead of going themselves In the same locality, amongst the modern Basques in Biscay, M Michel found the same custom prevailing a few years ago The women, he says, rise immediately after childbirth and attend to the duties of the household, while the husband goes to bed, taking the baby with him and thus receives his neighbours' compliments This practice seems to have spread to France and to have there received

the name of faire la couvade It has been found in Navarre and on the French side of the Pyrenees Diodorus Siculus mentions that in Corsica the wife was neglected and the husband put to bed and treated as the patient According to Apollonius Rhodius, the same singular custom prevailed among a people called the Tibareni at the mouth of the Black Sea Amongst the Caribs of the West Indies, the father is put to bed and fed on meagre diet and his body punctured and tortured, and the Abipon husband of S America is treated like a lying-in woman. — *Mar Muller Chips Apoll Rhod Argon* in 1012 *Taylor's Early History of Manland* quoted in *Quarterly Review*, July 1868

COVELONG, a small hamlet on the sea coast, 20 miles south of Madras

COVILHAM, Pedro da Covilham and Alfonso de Payva, were sent as merchants in 1494, via Genoa, Alexandria, Cairo and the Red Sea, to Aden, where they separated to meet again at Cairo, in Abyssinia, Payva, to search for Prester John, whom he heard of as reigning there over a highly cultivated people, but he died before reaching Abyssinia Covilham went on to India, where he made drawings of cities and harbours, especially, Goa and Calcutt Thence he returned along the coast of Persia to Cape Gardafui, and continued south to Mozambique and Zofala, where he ascertained that that land joined the Cape of Good Hope From Zofala he returned to Abyssinia and sent his diary, charts, and drawings to Genoa by some Portuguese merchants who were trading to Memphis On receipt of these, king Emanuel, in 1495, sent four ships under Vasco de Gama, who visited Natal and Mozambique, in 1498 he was at Calcutta, in 1499 back at Lisbon

In 1509, the Portuguese leader Sequiera entered the Eastern Archipelago In 1510, Alfonso Albuquerque visited Sumatra, and in 1511, took Malacca, which he fortified, and

sent out Antonio d' Abreu to search for the Spice Islands. On his way eastward, D'Abreu touched at Agasal (Gresik) in Java. In 1511, the Portuguese visited Bantam. Ludovico Baithema was the first European who described Java from personal observation, but some of his statements as to the cannibal propensities of the inhabitants are questionable. In 1596, the Dutch, under Houtmann first arrived off Bantam, and found the native king at war with the Portuguese. They lent him aid, on condition of having land allotted for a factory. In 1610, the Dutch fortified the village of Jacatra which they named Batavia. In 1619, this was destroyed, but it was then rebuilt by M<sup>r</sup> Bolt, the Dutch governor general, and this was the beginning of the present town of Batavia. In 1811, when France overran Holland, the flag of France was hoisted at Batavia, but in the same year the British captured it, only to restore it on the 19th August 1816. Java up to the 13th century was partly hindu, partly buddhist, partly mahomedan, but in the 15th century, mahomedanism took the lead, and in 1475 a mahomedan prince took the throne at the overthrow of the great kingdom of Majapahit, which had dominion over the whole of Java and the eastern parts of Sumatra. In 1749, the reigning prince abdicated in favour of the Dutch East India Company. Seven years prior to that event, the sovereignty had been divided into a spiritual head, the 'Susunan' or "object of adoration," whose descendants now reside at Surakarta near Solo, and a second prince who was styled sultan, and whose descendants reside at Jokyokarta, both of them highly pensioned — *Bikmore, p 22,26*

**COW** In many of the Aryan and non-Aryan tongues this is known as go, ngau-gu, or gai, thus the terms for a cow and ox are

Go, Gous pl	SANSK	Chuow	OLD HIGH GERM.

A good milch cow should have a good looking udder, fine skin and fine tail. In British India, a cow gives two to six seers of milk daily. Herdsmen of villages take out cows daily to graze, receiving 2 to 8 annas a month. In ancient Egypt the cow was a sacred animal as also were the bulls Apis and Mneves. At present, the cow is worshipped amongst all hindus, and the Banjara are perhaps the only race in British India who apply the cow to labour.

When the cow worship was introduced into India, is unknown. The Vedas do not enjoin reverence to the cow, and in

the marriage ceremony of some parts of the country, where a milk cow, Surabhai, is released on the intercession of a barber, sufficient remains to show that the sacrificial rate of killing a cow was formerly practised at marriages, for the sake of hospitality. The male buffalo is, however, frequently sacrificed, by non-Aryan races, sometimes in considerable numbers, and, only in 1859, the Government of Madras ordered the Magistrate of the Krishna Division to forbid the cruel rite of Annamavaru, wherein bullocks are impaled alive to appease the goddess Devi, and avert cholera. On that occasion, in a small village, twelve or twenty-four bullocks were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of men. In hindu mythology, the Cow of Plenty, granting all desires, is fabled to have been produced at the churning of the ocean by the Sura and Asura, after the deluge, for the recovery or production of the chroda-ratna or fourteen sacred things. Another fabulous cow, the cow of five colours, or "panch warna," is probably the famous cow Kam deva given by Indra to the parents of Rama. Amongst hindus, the donation of a milch cow is attended by many ceremonies, finishing with prayers, the acceptor, during the recital, holding the sacred animal by the tail. The boon-granting-cow Surabhai and her descendants are much revered by all classes of hindus above those that may be denominated base. It is common for brahmans and others to feed a cow before they take their own breakfast, ejaculating, as they present their food, "daughter of Surabhai, framed of five elements, suspicious, pure, holy, sprung from the sun, accept this food by me, salutation unto thee." Or, if he conduct the kine to grass, "May cows, who are mothers of the three worlds and daughters of Surabhai, and who are beneficent, pure, and holy, accept the food given by me — (*Colbrooke As Res vol vii p 276*) In marriage ceremonies a cow is one of the actors, the hospitable rites are conducted by letting loose a cow, at the intercession of the guest, a barber, who attends for that purpose, and exclaims, 'the cow! the cow!' upon which the guest pronounces this text—"release the cow from the fetters of Varuna. May she subdue my toe, may she destroy the enemies of both him (the host) and me. Dismiss the cow, that she may eat the grass and drink water." When the cow has been released, the guest thus addresses her, "I have earnestly entreated this prudent person, saying, kill not the innocent harmless cow, who is mother of the Rudra, daughter of the Vasu sister of the Aditya, is the source of ambrosia

&c" "It is evident," continues Mr Colebrooke, "that the guest's intercessions imply a practice, now become obsolete, of slaying a cow for the purpose of hospitality"—*Ibid*, p 293 In the Hitopadesa, (p. 110,) the earth is called Surabhi, and the learned translator (Wilkins) notes the same to be not usually so applied, although the earth may well be called the cow of plenty

The custom, in India, of using cow dung for smearing floors and walls, is practised by all sects, as well as hindus, as the most cool and cleanly appliance Cow-dung is plastered over the cooking-place before the meal of a person of a high class is cooked, in camps, or on journeys, a space of 10 or 12 square feet is so purified, but is easily polluted by the approach of impure persons or things, in which vexatious case the food becomes unholy The ashes of cow-dung "vibudi" are also of a very purifying nature, and hindus, of almost all ranks and degrees, men and women, occasionally, or frequently use them, mixed sometimes with other ingredients, to mark their forehead, necks, arms, &c Sometimes men, especially religious mendicants, or penitents, or those having some claims to sanctity, are rubbed all over with these ashy mixtures, and present a curious sky blue appearance Mahadeva is frequently painted blue or rather of an ashy colour, and the classes just noticed perhaps imitate that deity—or Krishna, also a deity of a blue or black hue. The ceremony of Kaishagni is obtained from a use of the cow-dung on one occasion of its performance, it happened, according to a legend, that a crow, named, from her friendly disposition, Mitra-caca, was present, and immediately flew and imparted the welcome news that a hindu who performs the kaishagni, goes to heaven This expiation consists in the victim covering his whole body with a thick coat of cow-dung, which, when dry, is set on fire, and consumes both sin and sinner Until revealed by the crow this potent expiation was unknown, and it has since occasionally been resorted to particularly by the famous Sankaracharya The friendly crow was punished for her indiscretion, was forbidden and all her tribe to ascend to heaven and was doomed on earth to live on carrion—(See Wilford) Amongst hindus, the greatest of all purifiers is the urine of a cow, hindu spirits of impurity abhor this sin expelling, sanctifying, liquid Images are sprinkled with it, no man of any pretensions to piety or cleanliness would pass a cow in the act of staling without receiving the holy stream in his palm sipping a few drops, and with his bedewed fingers, marking and crossing his forehead, shoulders, and breasts.—*Moor's Pan-*

Cowhage, probably a corruption of the Arabic or of Hindustanee and Bengali names of one of the plants that produce it, consists of the hairs found upon pods of different species of *Mucuna* They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin and produce an intolerable itching, hence they are frequently employed for mischievous purposes Cowitch is also used medicinally as a vermifuge, by being mixed with syrup till of the consistence

of honey, and given in doses of two or three tea spoonfuls. The species are found in hedges, thickets, on the banks of rivers, and about watercourses, in the East and West Indies, and in America within the tropics. *Mucuna urens* and *M. pruriens* usually furnish the substance, but that from *M. monosperma*, called by the Teluga, *Enooga dola Gunda*, or Elephant's Scratch Wort, is said to exceed the others in the irritating burning property of its hairs. Dr Roxburgh states that *M. pruriens* was one of the plants formerly used in India to poison wells, but it is less hurtful than was supposed — *Eng Cyc* p 177

Are small, white, or yellow, glossy shells, of the genus *Cypræa*, found in abundance on the shores of the Laccidive and Maldivé Islands, African Coast, Zanzibar, and the Sulu islands, &c. There are many species, the *Cypræa moneta* pass current as coin in payment of fractional parts of a pie in India and some parts of Africa. They are brought to Bombay in large quantities from the above named places in exchange for rice, and are re-exported to Britain, where they are used in inlaying, in ornamenting toys, work boxes, &c, and in the manufacture of the superior kinds of porcelain ware, they were, during the slave trade, exported from Bombay to Africa. The Cowrie is found in the Eastern Archipelago, but in considerable quantity only on the shores of the Sula group of islands, but seems never to have been used for money among the Indian islanders, as it has immemorially been by the Hindus. The Malay and Javanese name, however, is Sanscrit, *beya*, and is one of the synonyms which express duty, impost, or tolls. In the currency of India, four Cowries make a ganda, — 20 ganda = a pan, and 5 pan = one anna. In A D 1740, a Rupee exchanged for 2,400 cowries, in 1756 for 2,560 cowries, and in 1870, in Madras, as many as 5,760 cowries were obtainable for one rupee. The Persian name, *Khur-mohra*, means literally a jackass's or mule's shell, because mules are ornamented in that country with trappings of shells, as a gosain's bullock is in India. In Arabic it is called *Wuda*, which Ibn Batuta says is carried from the Maldivé Islands to Bengal, where it is used as coin. The Kamoos add that a split or broken shell is suspended from the neck to avert the evil eye, and this is still done in India. Among Eu-

ropean nations, excepting the British, these shells are known by the name Porcelli, Porcellan, Porcellanen and Porcelaine, on account of the fancied resemblance of their shape to that of the back of a little pig, whence arose the term for the Chinese "Porcelain," of which the glaze, or varnish, is similar to that of the cowrie. Liverpool imported as under

COYA, properly Gona maram, TAM *Psidium pynerum*

COW-TREE, a plant belonging to the natural order *Umbelliferae*, and apparently to the genus *Brosimum*. When wounded, a milky nutritious juice is discharged in such abundance as to render it an important object to the poor natives in whose country it grows. It is described by Humboldt as being peculiar to the Cordilleras of the coast of Guacas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in Caneagua, three days' journey east of Guacas. In these places it bears the name of Palo de Vaca, or Aibol de Leche, and forms a fine tree resembling the Star-Apple of the West Indies. The Kniaghna plant of Ceylon *Gymnema latifolium*, is a Cow-plant, notwithstanding it belongs to the *Aselepiadaceae* Order, which is acrid and dangerous. It is impossible to say what is the cause of their harmlessness, but it is capable of being explained — *Eng Cyc* page 178

#### CRAB

Khrichung	AR	Kapiting	MALAY

Cancei	LAT	Sunddiapu	TEL
Katam	MALAY	Nandiakara	"

The crab is one of the signs of the zodiac. There are representations of crabs on slabs of the Konyjik Gallery, in the British Museum, showing that the Assyrians must have been familiar with them. Athenæus, in some comments on the "Miser" of Theophrastus, says, "the tastes of the crab is one which many people have been very much devoted to, as may be shown by passages in different comedies." The crab is figured on many extremely ancient eastern coins, but for what purpose it was there represented, numismatists are not agreed. In books on natural history written in the middle ages, crabs are frequently spoken of, as well as very grotesquely represented. In China, a

traveller says, when our party of six had seated themselves at the centre table my attention was attracted by a covered dish, something unusual at a Chinese meal. On a signal, the cover was removed, and presently the face of the table was covered with juvenile crabs, which made their exodus from the dish with all possible rapidity. The crablets had been thrown into a plate of vinegar, just as the company sat down, such an immersion making them more brisk and lively than usual. But the sprightly sport of the infant crabs was soon checked by each guest seizing what he could, and swallowing the whole morsel without ceremony. Many observations have been made by naturalists since the time of Reaumur, as regards the crab during its periodical moultings. It escapes from its shell a soft harmless creature, incapable of exertion or resistance, and would become an easy prey to any of the devourers so common in the sea, were it not for a curious and wonderful display of instinct on the part of those of its brethren better protected than itself. As soon as the denudation is complete a stout specimen of the same species steps forward and defends it and takes care of it to the best of its ability until a new shelly case grows, and it is enabled again to protect itself, and present a strong back to its foe. When the species are young, the change of shell probably occurs oftener than once a year, indeed some writers say it occurs once or twice a month, and there is most likely a time when the change stops altogether and the animal may be considered as full-grown. If this sentinel be discovered and removed another will be found to have taken its place after the following tide and this will be repeated many times in succession.

The stories of crabs and other crustacea casting away their limbs when alarmed or frightened, as on the occasion of a thunder-storm or on the firing of a cannon, are considered to be quite authentic. When a claw has sustained any injury, it is cast off by the animal, and a new one in due time takes its place. The migratory land-crab is one of the greatest curiosities of the crustacean family. It is a native of warm climates, and is plentiful in the Bahamas and other islands, living in the mountains, in the interstices of rocks, in the clefts of trees, and in holes bored in the sand. A curious little crab of the Malacca Straits, has been named by Mr. Bate, *Sphærapœna*. Collingwood, because of its taking in sand to eliminate its food, and ejecting the sand in the form of a pill. They are gregarious. The *Phyllosoma* are styled glass crabs. The *Gelasini* land crabs, of the East and West Indies, bore holes for themselves in the black soil of the coasts. One of their claws

is much larger than the other, and, when running, they carry it aloft. The humble little calling crabs of Ceylon, *Gelasinus tetragonum*, *G. annulipes* and *G. Dussumieri*, *Edw.* have an enormous hand, often larger than the rest of the body, which, as they scamper over the sands, they carry aloft. The *Ocypode ceratophthalmus* of Ceylon, burrows in the dry soil, jerking the sand to the distance of seven feet. The painted crabs are the *crabes peints*, "also" *crabes violets*, of the French *Grapsus strigosus*, *Herbst*, is distinguished by dark red marks on a yellow ground, they are found on the reef to the south of Colombo harbour. *Gecarcinus curmifex* occurs near Pondicherry, *Egeria indica* inhabits the Indian seas and has a great resemblance to *Inachus scorpio*. *Padling* Crabs, *Neptunus pelagicus*, *Linn* and *N. sanguinolentus*, *Herbst*, have their hind pair of legs terminated by flattened plates to assist them in swimming. Crab Larvæ are called *Zoeæ*—*Ainslie's Mat Med* p. 12. *Sir J. E. Tennent's Ceylon* 477. *Collingwood's Travels of a Naturalist Long Cyc*. See Crustacea.

**CRACKERS, &c.** The largest proportion of Chinese fire-crackers go to the United States, some are shipped to India and South America. They are made up in strings, and then in papers, and lastly in boxes, five of which are estimated to weigh one peck. **CRANE** Several eminent naturalists ignore the great differences between 'Storks' and 'Cranes,' though they differ in their appearance, habits, anatomy, modes of breeding, and everything, except that both happen to be long legged birds. They do so by designating the *Hurgila* or 'Adjutant', '*Leptoptilus argila*' "the gigantic Crane." The ordinary Indian Cranes, *Grus antigone*, *Gr. cinerea*, *Gr. virgo*, and *Gr. leucogeranus*, occur rarely in the North West Provinces. The words Crane, Geranos and Grus, and the Hindustani names of the three common Indian species, *Saras*, *Karianch*, and *Kakaira*, all have reference to the loud trumpeting of these birds, which have a curious internal conformation resembling that of the Trumpeter Swans, whereas the Storks are voiceless birds, having actually no vocal muscles, and

can make no sound but by clattering their mandibles together, which they do pretty loudly. The ridge or keel of the breast bone, common to all birds that fly, is, in the Crane, belonging to the restricted genus *Grus*, and in the Trumpeter Swans, expanded so as to form a cavity, which the wind pipe is prolonged to enter and proceed from, after describing a vertical convolution therein. Mr Yarrell's figure of this curious structure, as it exists in the Hooper Swan (*Cygnus muscivorus*) is, in a general way, indicative of it, as observed in the booby, the trichee even performs a second vertical convolution, while in the wild Swan of North America (*C. americana*) and in the newly arrived Bewick's Swan (*C. B. bewickii*) it is prolonged to form a horizontal loop in the body of the sternum, posterior to the vertical convolution within the loche, that is, in general, for several of Bewick's Swans do not differ in this respect from the Hooper Swan, although to all appearance of full age and development. In a newly hatched Hooper Swan examined, not even in indication of the peculiar structure described could be detected, nor does it occur in the two species of Crowned Crane (*Bucconia*) nor in the Mute Swans (*Cygnus olor*, *C. immutabilis*, *C. atratus*, *C. nigricollis*), nor probably in the *C. crested* of South America, but the Crowned Cranes exhibit one curious anomaly in the organ of voice, which is that the long tendinous muscles, the office of which is to contract the windpipe, and which are known as the sternotracheides, from their ordinary mode of attachment, are not fixed, as usual, at their lower extremities to the sides of the breastbone, but to the middle of the first pair of ribs. The sternotracheal muscles are wanting to the 'Adjutant' and most other Storks, and in a very few other birds, such as the Condors (*Sarcophilus*) of the Vulture family, indeed the Vultures generally are among the most silent of the feathered creation, emitting no sound beyond a feeble cackling and snorting in their eagerness over their prey. In Australia the term 'Crane' is applied to the Egrets or white Paddy birds, as they are called in India, while in the Malay countries the so called Paddy bird is a Finch, and the real Crane of Australia is known as the 'Native Companion'.

Among the gallatores or waders, some cranes and storks, four-fifths of the ducks and the great majority of the scolopacidae breed in the north and come to India in the cold season. There are four species of cranes in India, all of them principally or solely winter visitors.

Of the species more or less diffused over India while in their winter quarters, two belong to the division termed *Antigone*, one

to restricted *Grus*, and one to *Anthropoides* of Blyth.

1 *Antigone torquata*, *Grus antigone* of Linnæus, *Grus torquata*, Vieillot, the Sarus, a noble bird, is the largest of the whole tribe. During the breeding season it has a pure white collar below the crimson papillose naked portion of the neck, whence the name *torquatus*. It is mostly seen in pairs, a few of which breed in India in extensive flocks, but the great majority cross the Himalaya for that purpose.

2 *A. leucogeranus*, *Grus leucogeranus* of Pallas, is the beautiful Large White Crane of Northern Asia, with black wing primaries, and crimson naked face. A few stray pairs have been observed from time to time south of the Himalaya, in the Upper Provinces of Hindustan, and Burnes figured it from the vicinity of Kibul. Instances of its occurrence within the confines of India are worthy of special record. Mountaineer once or twice indicated this fine bird in his narratives of trans-Himalayan peregrinations.

The other Cranes have shorter and slate-colored legs, and less (or in one instance not any) naked skin about the face.

3 *Grus cinerea*, L., *C. vulgaris*, Pallas. The Kullung or Kirinich, or European Crane, common to Asia and N Africa. Visits India in great flocks, which wholly disappear in the breeding season.

4 *Gr* (or *Anthropoides*) *vigo*, L. The Kikari, or 'Demoiselle,' common to Asia and North Africa, is only known in India during the cold weather, but it reaches further southward. It is the smallest of the cranes, and certainly one of the most elegant of this particularly graceful group, the only one with the head fully feathered, and it is adorned with beautiful white neck-tufts, and with lengthened and drooping tertaries, and a bright crimson eye. Highly gregarious, the flocks are sometimes immense.

All of the Cranes are easily tamed and soon become reconciled to captivity, and they are very ornamental birds to keep. They have a curious and peculiar habit of skipping about at times, attitudinizing or dancing, and now and then emitting their loud cries. In the wild state they do much damage to the crops from their numbers, and repair during the heat of the day to sand-flats in rivers, or to other extensive waters, returning to feed morning and afternoon, at regular hours. They fly in V-like flocks, like Wild Geese. The young, commonly two in number, follow the mother soon after exclusion, unlike those of the Stork and Heron tribe, with which the Cranes have little in common. The Marabow feathers, are the under tail coverts of the

Leptoptilusaigala, and C mirabow, the former, the adjutant-bird of tropical India, furnishes the best, the latter inhabits Africa and Asia, both birds are very large, being sometimes six feet high — *Z in Indian Fields' Diamond Com Dict* See Birds, Cygnus, Egret, Stork

CRANGANORE, on the Malabar Coast, in lat 10° 12' N, is built on the Cranganore or Aycotta River Cranganore seems to have been one of the most ancient capitals of Malabar, and in some of the ancient copper deeds appears to be called Muzim-Kodn, which a writer in the Madras Journal indicates as perhaps identifying it with the classical Muziris (?) — *Horsburgh Yule Cathay II* p 373

CRANGONIDÆ, a family of *Crustacea* belonging to the division *Decapoda Macroura* The type of the family is the common shrimp, *Crangon vulgaris*, and no other genera are included in it The Common Shrimp has the Carapace and abdomen almost entirely smooth, with the exception of one small median spine on the stomacheal region — *Eng Cyc* p 188 See Crustaceæ

CRANGON VULGARIS The Common Shrimp See Crangonidæ

CRANIA A genus of molluscs

CRANI An English copyist or clerk in a public Office, generally of mixed European and Native descent The origin of the name has been disputed, and is, it is believed, utterly unknown It may probably be a corruption of some Portuguese word, or it may be a mispronunciation of Carani, by which the Kayet'hs (Cayast'hs), or writing tribe, is designated in Bengal, and as most native writers in Public Offices are of the Carana caste, it is not unlikely that by merely extending its signification, the same word have been used to designate English writers The word from being utterly harmless in its application, has begun of late years to be considered decidedly dyslogistic, (to use an expressive word coined by Bentham) and is consequently avoided by all officials of good feeling, for fear of giving offence There is no reason to suppose that in India Kayet'hs, are now ever called Khwaja, though that word is in common use for other classes In mahomedan countries, however, the term khwaja is still applied to writers and teachers Dr Shaw says of the Moors in Barbary, "The Hojas suspend their ink-horns in their girdles," (p 227) and Lady Montagu says, "The monastery is now belonging to a Hoja, or school master" — *Letters* p 176 *Elliot, Supplement*

Common in gardens and groves in lower Bengal and in the Concan, cultivated as a hly in Ajmir gardens, the flowers are fragrant and ornamental. The Bengali name means enter-view of ease. The root of the variety toxicarium is a good substitute for squill. The succulent leaves of this plant are about two inches broad and two or three feet long. The natives bruise and mix them with a little warm castor oil, and consider them extremely useful for repelling whtlovs, and other inflammations, on the ends of the fingers and toes, the juice of the leaves is applied to the ear opening in ear ache, its juice is

emetic, but very irregular in its action. From two to four drams of recent bulbs are mild emetic, and are used in Hindustan for the purpose of producing vomiting after poison has been taken, especially that of the Antiaris.

The syrup is nauseant and emetic for children. Dose, a dessert spoonful repeated as required. An infusion is a mild and certain emetic. In doses of two drachms given every twenty minutes, this solution occasions nausea and perspiration. It does not cause griping, purging, or any other distressing symptoms — *Beng Phar* p 301 111 *Genl Med Top* p 138 *O Shaughnessy*, page 655 *Ainslie's Mat Med* p 301 *Eng* (34 p 195

CRIOCERIDÆ One of the Coleoptera

CRISHNA, familiarly Kamyā, also called Heri, and written Krishn, Kish, Kistna, and Krishna, was of the tribe of Yadu, the founder of the fifty-six tribes (Chah-pān kula Yadu) who obtained the universal sovereignty of India, and was descended from Yayat, the third son of Swayambhūma Manu, also called Varaswata-manu or the man, Lord of the earth, whose daughter Ella, *Terra*, was espoused by Budha (*Mercury*), son of Chandra, the Moon, whence the Yadu are styled Chardravansi, or children of the moon. Budha was therefore worshipped as the great ancestor, *Pitriswata*, of the lunar race, and previous to the apotheosis of Crishna, was adored by all the Yadu

race The principal shrine of Budha was at Dwarien, where he still receives adoration as Budha Triviamia, the triple energy, like the Hermes Triplex of Egypt Krishna or Kanya lived towards the conclusion of the brazen age, calculated to have ended about 1160 to 1200 years before Christ He was born to the inheritance of Vrij, the country of the Suraseni, comprehending the territory round Mathura for a space of eighty miles, of which he was unjustly deprived in his infancy by his relative Kansa From its vicinity to Delhi we may infer, either that there was no lord paramount amongst the Yadu of this period, or that Crishna's family held as vassals of Hastinapoor, then with Indraprestha or Delhi, the chief seat of Yudu power There were two princes named Surisen amongst the immediate predecessors of Crishna one, his grandfather,—the other eight generations anterior Which of these was the founder of Surapoor on the Yamuna, the capital of the Yadu, we know not, but we may assume that the first gave his name to the region around Mathura, described by Arrian as the country of the Surasen Alexander was in India probably about eight centuries after the dedication of Crishna, and it is satisfactory to find that the inquiries he instituted into the genealogy of the dynasty then ruling on the Yamuna, correspond very closely with those of the Yadu of this distant period, and combined with what Arrian says of the origin of the Pandu, it appears indisputable that the descendants of this powerful branch of the Yadu ruled on the Yamuna when the Macedonian erected the altars of Greece on the Indus That the personage whose epithets of Krishna-Sham designate his colour as the 'Black Prince,' was in fact a distinguished chief of the Yadu, there is not a shadow of doubt, nor that, after his death, they placed him among the gods as an incarnation of Vishnu or the Sun, and from this period, we may deduce the hindu notion of their Trinity Arrian enumerates the names of Budæus and Cradevas amongst the early ancestors of the tribe then in power, which would alone convince us that Alexander had access to the genealogies of the Puranas, for we can have little hesitation in affirming these to be Budha and Croshthdeva, ancestors of Crishna, and that "Mathoras and Chsoharas," the chief cities of the Surasen, are the Mathura and Surpoo occupied by the descendants of Surisen Fifty-seven descents are given, both in their sacred and profane genealogies, from Crishna to the princes supposed to have been contemporary with Vicramaditya The Yadu Bhatti or Shamah Bhatti (the Asham Betti of Abul Fazl), draw

their pedigree from Crishna or Yadunath, as do the Jhaieja of Kutch (See Krishna) When Aurangzeb proscribed the idol of Kanya, and rendered his shrines impure throughout Vrij, Rana Raj Sing offered the heads of one hundred thousand Rajpoots for his service, and the god was conducted by the route of Kotah and Rampoor to Mewar An omen decided the spot of his future residence As he journeyed to gain the capital of the Seesodia, the chariot wheel sunk deep into the earth, and defied extrication, upon which the Sookum (Augur) interpreted the pleasure of the god, that he desired to dwell there This circumstance occurred at an inconsiderable village called Siarh, in the fief of Dailwara, one of the sixteen nobles of Mewar Rejoiced at this decided manifestation of favour, the chief hastened to make a perpetual gift of the village and its lands, which was speedily confirmed by the patent of the Rana Nat'hji (the god) was removed from his car, and in due time a temple was erected for his reception, when the hamlet of Siarh became the town of Nat'hdwara, which now contains many thousand inhabitants of all denominations, who, reposing under the especial protection of the god, are exempt from every mortal tribunal The site is not uninteresting, nor devoid of the means of defence To the east it is shut in by a cluster of hills, and to the westward flows the Bunas, which nearly bathes the extreme points of the hills There are seven celebrated images of Crishna in Rajputanah —*Tod's Rajasthan* See Krishna

CROCODILE

Mag'i	HIND	Buwaya	MALAY
Kumhir	"	Sisan	SIND
Bayi	JAV	Ali Kimbula	SINGH

*Crocodylus biporcatus*, *Cuv*, and *C palustris*, *Less*, are numerous in the Ceylon lagoons, and in the stomach of one there were found several small tortoises and broken bricks and gravel They are present in all the larger rivers of the peninsula, the Kaveri, Kistna, Godaveri and their feeders, also in the Indus and its feeders, in the Ganges and its feeders, in the Irawadi and its feeders, and in all the rivers of the Malay and Philippine Archipelago. The Malays

of the peninsula reckon three species, the labu or goid, the kutak or frog, and the tambaga, or copper crocodile. That found in Sumatra and Java is the *Crocodilus biporcatus* of naturalists, which is found also in Celebes and Borneo, and the Moluccas, but in addition to this, there is another in the rivers of Borneo, formidable by its size and capacity, partaking of the character of the *biporcatus* and the gairal of the Ganges—(*Crawford*, page 10) Crocodiles of enormous size are seen in every creek, in every river in the Sunderbuns these have a broad flattened muzzle, with unequal teeth of a formidable size and shape, the outline of the jaw, where the teeth are seen protruding interlocked with each other, is a waving line, giving to this ugly animal a fierce and cruel aspect. Crocodiles are eaten on the Sind frontier. The animals on the Ganges, varying in size from a span in length to 18 or 23 feet, are usually seen lying on the surface of the black mud basking in the sun, they sleep very soundly, for a steamer may be seen going at full speed, and making the usual splash and noise, passing within ten paces of a sleeping crocodile, without disturbing its slumbers. To a casual observer they resemble mud-covered logs of wood and it is not until the large square glittering scales which are of exceeding strength and beauty when closely examined, and the elevated and doubly dentelated ridge or crest that runs along either side of the tail become visible, or are seen to glisten in the sun, that the shapeless mass is found to be a fierce, carnivorous and dangerous animal. The Gangetic gairal is not seen in the Sunderbuns, it appears to love the sweet, and comparatively speaking quieter waters of the upper rivers of India and their clean sandbanks, where they may be seen lying with their mouths wide open, but for what purpose it is difficult to divine, unless it is to get rid of numerous small red filamentous worms that cluster about their fauces. The lower jaw being prolonged backward beyond the skull, causes the upper jaw to appear moveable, which it only is when accompanied by the whole of the skull, entire head, but not otherwise. A small brown bird has been seen to alight upon the tongue of an open mouthed crocodile and pick the worms from the throat as it lay upon a sand bank in the Ganges. It is generally believed that the snubbed nose crocodile always remains in fresh water, but such is not the case, as they are found all along the Chittagong and Arracan coasts, never far from the shore it is true, but still in *bona fide* salt water, where they are as dangerous as sharks. In the rivers of the Delta of the Ganges,

where they flow through the cultivated portions of the country, stakes are driven into the bed of the river at the watering places or ghauts, opposite to the villages, where the inhabitants may bathe in security and draw water for domestic purposes, but even this precaution is not always sufficient to ward off the attacks of the fierce crocodiles. The crocodile being an amphibious animal, finds no difficulty, when pined by hunger, in turning the flank of the stakes, and taking up his post within the enclosure, where he silently awaits his prey. A surveyor on the banks of the Gorace, was witness to a shocking occurrence in connection with these enclosures. A young hindu girl, about 14 years old, came to fill a pitcher with water, and had hardly put her feet into the water, when a crocodile, which had been lying in wait inside the enclosure, rushed at the poor girl, seized her in its formidable jaws, scrambled up the banks of the river, holding the shrieking, struggling girl well up in the air by the middle of her body, and plunged heavily into the river outside of the stake. A smothered scream, a ripple upon the water, a few bubbles, and the frightful scene was closed. A more daring attack by a Sunderbun crocodile than even the above, occurred a few years ago at Hoolna a gang of ironed convicts were being inspected by the magistrate prior to their being sent off to another and a more distant jail, the men, numbering with their guards about fifty, were drawn up in line on the raised embankment or levee of the river, the examination was proceeding, when a crocodile rushed up the bank, seized a manacled prisoner by the legs, dragged him from the banks, and in a moment, and that before any assistance could possibly be rendered, had plunged into the river and disappeared. A small specimen of the *Crocodilus biporcatus*, 6 feet long, Mr Blyth tells us, was taken out of the Wellington tank of Calcutta. The *Crocodilus palustris* of Lesson, likewise occurs in India. The Pee-puker at Pundooa is a large tank, forty feet deep and 500 years old. The most remarkable tenant of this tank was a tame crocodile called Fateh Khan, which obeyed the call of a fakere living upon the embankments. On summons, the monster shows itself upon the surface and keeps floating for several minutes. Captain von Orlich saw thirty crocodiles in a tank near Kuriachee, who at the call of the fakere instantly crept out of the water, and like so many dogs lay in a semi-circle at the feet of their master. In Colonel Tod's time there were two crocodiles familiar to the inhabitants of Oodipoor, who came for food when called. He often exasperated them by throwing an inflated bladder which

the monsters greedily received, only to dive away in angry disappointment. It was on one of these that a Rajput chief affirmed he had ventured to swim. Portions of these reptiles have been discovered fossil in the Sewalik Hills and in Burma. In India, the crocodiles are often called *dhigitors*, but the former are confined to the old and the *dhigitor* to the new world, to tropical and Southern America, where they are styled also *Cayman*, *Jacur*. The alligator closely resembles the crocodile, but his characters sufficiently distinct to have constituted a new genus.

In Egypt, the crocodile was sacred to Typhon and to the god of Papremis.

In Siam the flesh of the crocodile is sold for food in the markets and bizzars. Bishop Pallegoix (v. p. 174) relates that un jour je vis plus de cinquante crocodiles, petits et grands attachés aux colonnes de leurs maisons. Ils les vendent la chair comme on vendrait de la chair de porc, mais à bien meilleur marché.

A native of Ceylon who resided for a long time at Cultra, told Sir J. E. Tennent, that in the rivers which flow into the sea, both there and at Bentotte, crocodiles are frequently caught in eorials formed of stakes driven into the ground in shallow water, and so constructed, that when the reptile enters to seize the bait placed within, the aperture closes behind, and secures him. A professional "crocodile chatmer" then enters, muttering a spell, and with one end of a stick pats the creature gently on the head for a time. The operator then boldly mounts astride upon its shoulders, and continues to soothe it with his one hand, whilst with the other he contrives to pass a rope under its body, by which it is at last dragged on shore. This story serves to corroborate the narrative of Mr Witterton and his alligator. The Singhalese believe that the crocodile can only move swiftly on sand or smooth clay, its feet being too tender to tread firmly on hard or stony ground. In the dry season, when the water courses begin to fail and the tanks become exhausted, the marsh crocodiles have occasionally been encountered in the jungle, wandering in search of water. During a severe drought in 1844, they deserted a tank near Kornegalle and traversed the town during the night, on their way to another reservoir in the suburb, two or three fell into the wells, others, in their trepidation, laid eggs in the streets, and some were found entangled in garden-fences and killed.

Generally, however, during the extreme drought, when unable to procure their ordinary food from the drying up of the water-courses, they bury themselves in the mud, and remain in a state of torpor till released by the recurrence of rains. At Arne-twoe,

in the eastern province, whilst riding across the parched bed of the tank, he was shown a recess, still bearing the form and impress of a crocodile, out of which a crocodile had been seen to emerge the day before. A story was also related to him of an officer attached to the department of the Surveyor General, who, having pitched his tent in a similar position, was disturbed during the night by feeling a movement of the earth below his bed, from which, on the following day, a crocodile emerged, making its appearance from beneath the matting. They are said to eat only living creatures, but the dead bodies in the Ganges are also said to be eaten by them. Little is known as to the usual food of the crocodile. Herodotus (Enteipe viii) records the observations of the Egyptians that the crocodile of the Nile abstains from food during the four winter months, and in Java it is believed that they will eat only living creatures. A curious incident occurred some years ago on the Mugurugangi stream, which flows through the Pasdum Corle to join the Bentotte river. A man was fishing seated on the branch of a tree that overhung the water, and to shelter himself from the drizzling rain, he covered his head and shoulders with a bag, folded into a shape common with the natives. While in this attitude, a leopard sprang upon him from the jungle, but, missing its aim, seized the bag and not the man, and fell with it into the river. Here a crocodile, which had been eyeing the angle in despair, seized the leopard as it fell and sunk with it to the bottom. — *Letter from Gooneratne Moodelliar, Interpreter of the Supreme Court 10th January 1861 Cal. Rev. Jo. B. A. S. Lowe's Sarawak, p. 83 Tennent's Sketches of the Natural History of Ceylon, p. 288 See Crocodile*

CROCODILIDÆ, the crocodile tribe, a family of Saurians, of the order Emydosauri, which includes also the family Gharialidæ, comprising the largest living forms of that order of reptiles. Dumeril and other naturalists distinguished the family by the appellation of Aspidiot (shielded) saurians, while many modern zoologists have considered them as forming a particular order. They form the Loricata of Meirem and Fitzinger, and the Emydosaurians of De Blainville. They may be shown as under —

A native of Asia Minor, naturalized in England, France, and many other parts of Europe, and cultivated in Persia and Cashmere. The saffron of commerce consist of the dried stigmata of the flower. These are picked out, dried on paper either in a kiln or by the sun. If compressed into cakes, it is accordingly called coke saffron, hay saffron is what is usually met with, and it consists of the stigmas, each about an inch and a half long, brown red, the upper part flattened, widened, and cleft, the lower, hair-like and yellowish. The odour is fragrant, taste bitter, but agreeable. Saffron tinges the saliva yellow. Mr Pereira informs us that one grain of good saffron contains the stigmata and styles of nine flowers, so that one ounce of saffron is equal to 4,320 flowers. Cake saffron as now met with contains none of the real article, being prepared from the florets of the safflower (see *Carthamus*) made into a paste with gum water. Dr Hombergber, mentions that *Crocus sativus* is monopolized by the Cashmerean government and that the Hakims of the Punjab use saffron in melancholy, typhus fever, enlargement of the liver, and retention of urine — *O'Shaughnessy, p 654 Hombergber, p 263 Royle, p 688 Birdwood. Waring* See Saffron

**CROMLECH**, is a word applied by the British to widely different structures. Its true meaning is a circle of upright stones, like the "hurleis" and "nine maidens" in

**Cornwall** The cromlech of the British antiquarian is the same as the Welsh and English "quoit," such as Arthurs quoit or coetan, near Criccieth, Lanyon quoit and chun quoit and others in Cornwall. Stanton Drew quoit in Somersetshire, the Kitts Koty or quoit, near Maidstone and the Coit-y-curoc in Guernsey, all of them circles of upright stones. Professor Sven Nilsson (*On the Stone Age, p 159*) defines the English cromlech as synonymous to the French dolmen, the Scandinavian dos and the dyss of Denmark, consisting of one large block of stone supported by some three to five stones arranged in a ring and intended to contain one corpse only, several of these dorsa being sometimes enclosed in circles of raised stones. Following, however, the nomenclature given by the late Dr Lukis, we cannot be far wrong in assigning the word cromlech to all elaborate megalithic structures of one or more chambers, in which category the passage graves may be included.

The Dolmen (Dala table, moen a stone), is as its name implies, of different structure. The cromlechs of Jersey and the adjacent islands partake of the character of the French Grottes aux Fées, the fairy's grotto, as well as the Gangrifer, the gallery tombs of the Swedes, the jettestuci or chambered tumuli of the Danes and the German, Hünengraben.

In China, the chambered tumuli associated with megalithic avenues have attained their greatest development. The great tomb (the Ling or resting place of Yung Lo of the Ming dynasty) thirty miles from Peking, consists of an enormous mound of earth and briar covered with trees, and surrounded by a wall a mile in circumference. In the centre of the mound is a stone chamber containing the sarcophagus in which is the corpse. This chamber or vault is approached by an arched tunnel, the entrance to which is bricked up. This entrance is approached by a paved causeway passing through numerous niches, galleries, courts and halls of sacrifice, and through a long avenue of colossal marble figures sixteen pairs of wolves, kelmis, lions, horses, camels, elephants, and twelve pairs of warriors, priests and civil officers.

The tombs of the Hova race of Madagascar consist of stone vaults, made of immense slabs of stone, flat inside, forming a subterranean grotto. They also erect stone pillars similar to the menhir. The supposed aborigines of Madagascar were the Vasinba, whose tombs are small tumuli or cairns, surmounted by an upright stone pillar. The "Celt" chopping or hewing stone, the thunderbolt, the corn de foudre, laire de tonnerre, the Til lugger steen of the Germans, may have been the moen sourons of Brittany, a hatchet, axe, chisel, adze or wedge. They are numerous in the Channel

Islands Those found in the Carnatic are of fibrolite, those of the Swiss lakes are of jade The Cromlech or tri-lithic altar, in the centre of all Druidic monuments, is supposed by Todd to be a "torium" or triumphal arch, sacred to the sun-god Belenus — *Lt Oliver, R A F R. G S Quarterly Journ of Science, April, 1870* See Cairn

CRORE, or CROR Ten millions, a crore of rupees is equal to one million sterling The names of the higher numbers are thus given in the "Zibdat-oul-Quamm" 100 crore = 1 Urub 100 Urub = 1 K, hurub 100 Kh, urub = 1 Neel 100 Neel = 1 Pudum 100 Pudum = 1 Sunk, h 100 Sunk, h = 1 Uld 100 Uld = 1 Unk 100 Unk = 1 Pudha — *Elliot*

CRORI When Akbar introduced his revenue reforms, he appointed a Collector for every Crore of Dams, (i e, 2,50 000 Rs) whom he designated by the title of Amil or Amilguzar, and to that functionary the instructions are directed in the Ameen-i-Akberee, the designation of Crori being of subsequent introduction — *Elliot*

CROSS The symbol of the circle and the cross under every variety of circumstance, in Egypt, Africa, Britain, China, Scandinavia, and America, in every age, by every people, from the dawn of secular history to the present hour, has been held by all in the same superstitious veneration, been honoured with the same distinguishing rites, and has always expressed the same doctrine of mystery Divine potentiality was sometimes indicated by two or more sceptres ranged at right angles or quadrantly, with the nave of a wheel, or a simple circle, or six or eight round stars, at the point of intersection, with other orbs or ornaments Osiris by the cross gave eternal life to the spirits of the just With the cross Thor smote the head of the giant serpent, the Muisca mothers laid their children beneath a cross trusting by that sign to secure them from evil spirits The Cross-cake, says Sir Gardner Wilkinson, was the hieroglyph for 'civilised land,' obviously a land superior to their own, as it was indeed to all other mundane territories, for it was that distant, traditional country of sempiternal contentment and repose, of exquisite delight and serenity, where nature unassisted by man produces all that is necessary for his sustentation, and whose midst was crowned with a sacred and glorious eminence—the umbilicus orbis terrarum—towards which the heathen in all parts of the world and in all ages turned a wistful gaze in every act of devotion, and hoped to be admitted, or rather to be restored, at the close of this transitory scene The Crux ansata is the earliest known form of the cross It is commonly called the

key of the Nile, because often seen on Coptic and Egyptian mountains It was very similar to the Roman letter T with a roundlet or oval placed immediately above it, and signified hidden wisdom of the life to come It was used by the Chaldeans, Phenicians, Mexicans and Peruvians, doubtless it was intended to denote the solar and terrestrial spheres, and subsequently sovereigns each adopted the circle associated with it the cross, and thus symbol of royalty is in use with every king of Europe The Chakra in the hands of Brahma, Vishnu, and Siva, is a modification of it In Egypt and China it was used to indicate a land of corn and plenty, and when divided into four equal segments, it was the symbol of the primeval abode of man, the traditional paradise of Eden The cross, says Colonel Wilford (*As Res* x, p 124) though not an object of worship amongst the buddhists is a favourite emblem and device amongst them It is exactly the cross of the Manchees, with leaves and flowers springing from it (and fruit also it is said) It is called "the divine tree," "the tree of the gods," "the tree of life and knowledge," and productive of whatever is good and desirable, and is placed in the terrestrial paradise"

The pre christian cross is not unfrequently associated with a tree or trees The sign of the cross began to be used by christians in the fourth century, and is described by Lactantius as an impregnable fortification to defend those impressed with it, for such the devil cannot approach—?

CROSS ISLAND, a small island three-quarters of a mile from the shore in Bombay harbour — *Horsburgh*

The *Crotalaria juncea* is cultivated for its fibre in many parts of India, and bears several names in the districts. Its fibres make a good strong hemp for cordage, canvas, and sackcloth, twine and paper. It is sown very thickly at the beginning of the rains, so that it may grow tall and thin and in favourable soil it grows to 8 or 10

feet high. When it begins to flower, it is cut near the root, tied in large bundles, and immersed in water, putting some weight on it, generally mud, to prevent it from being carried away. After remaining immersed from four to eight days, it is withdrawn from the water, taken by handfuls, beaten on a piece of wood or stone, and washed till quite clean, and the cuticle with the leaves completely removed from the other portion of the plant. Each handful is then piled musket fashion, and left to dry. When perfectly dry, the woody portion, which has been more or less broken, is separated from the fibre by further beating and shaking. From 3 to 6 mannds of fibre are extracted from each beegah of plant. The raw material on the field, as plant, costs from two to four rupees per beegah according to quality, and the prepared fibre costs from four to ten rupees per maund, according to strength, length, and cleanliness of fibre. The exports from Madras in the year 1850-51 were

**CROTALARIA SERICEA**, WILLD syn of *Crotalaria juncea*, Linn.

**CROTALARIA TENUIFOLIA**, ROXB  
Jubbulpore Hemp, is a native of Coromandel perennial, ramous, straight, furrowed, hoary. Leaves linear, sericeous underneath. Stipules minute, subulate. Racemes terminal. Legumes sessile, clavate, many-seeded. In the Botanic Garden, Calcutta, it is perennial, growing to the height of nine feet, with numerous slender, furrowed, straight branches, which are again more ramous at the top. During the cool season, each twig ends in a long raceme of large, yellow flowers, and seed ripens in two months. It grows to 6 or 9 feet high, and yields the fibre known in England and Calcutta as Jubbulpore hemp, which is considered equal to Russian, and bears a heavier weight. Dr Royle reports as under

Kind and quality of rope	Size	Govern- ment Proof	Break- ing weight
	Inches	Cwt	Cwt qr
Oiled Jubbulpore Hemp			
Artillery Traces,	3	36	43 2
Untarred do, superior

Untarred Dhunchee (Æs- chynomene cannabina, Rox), Sesbania aculeata,	3½	49	75 0
Pine apple fibre,	3½	42	57 0

A good deal of the value of this plant is supposed to be the result of the climate and soil in which it is grown. About the year 1846, Mr Williams, having occasion to send to Calcutta samples of wax, oil seeds, and other materials, filled up the box with indigenous hemp to prevent breakage of the bottles. On arrival at Calcutta, the cleanness and brightness of the fibre struck the consignee, and he had it examined by one of the proprietors of the patent rope-works, who pronounced it equal to the best Russian hemp, and at once sent an order for 400 maunds of it. The trade, since then, gradually increased, and Mr Williams afterwards sent about 6000 maunds, (about 200 tons) of this fibre to Calcutta. The plant is regularly cultivated, but the cultivation is limited. About 10 per cent of the fibre is lost in the process of heckling, and the cost varies according to the several places in the district and seasons of the year. The price of the prepared fibre is from 3 Rs 8 As to 4 Rs per maund — *Royle's Fib Pl Roxb Fl Ind Cal Cat Ex 1862*

Croton Oil	ENG	Dund	PERS
Napala Oil	"	Nirvālam yennai	TAM
Jumalgote-ka-tel	HIND	Naypalam vittilu	
Tiglu oleum	LAT	nuna	TEL

This oil is prepared by grinding the seeds of *C tiglium*, placing the powder in bags, and pressing between plates of iron, the oil thus expressed is allowed to stand about a fortnight, and then filtered. It is of an orange yellow colour, is soluble in alcohol, and reddens litmus paper powerfully. It is an exceedingly powerful cathartic. It has a heavy oily smell, and is very irritating to the skin. It is procurable in most Indian bazars, often adulterated with castor oil and other fixed oils. In Burmah, the seeds are administered by native doctors, and when the operation is excessive, they give the patient the juice of the sour lime, which is said to counteract the effect of the croton seeds.—*M. E. J. R. Faulkner Mason*

**CROTON PAVANA** AVA Croton Lindley says that there is an indigenous species at Ava, which is decandrous, while *C tiglium* has fifteen stamens.—*Mason* See Croton tiglium

This small tree grows to 15 or 20 feet high in most parts of India, the Peninsula, the Concans, Assam, and in the Moluccas. Every part of the plant is purgative, but the

fruit or seeds are dangerously so, and in the medicinal practice of Europe, they are never given, the oil expressed from them being alone used. In India, however, the native practitioners separate the embryo, and give it internally. The seeds yield a powerfully cathartic oil. It is prepared by grinding the seeds, placing the powder in bags, and pressing it between plates of iron. The oil is then allowed to stand fifteen days, and afterwards filtered. The residue of the expression is saturated with twice its weight of alcohol, heated on a sand bath from 120° to 140° Fahr, and the mixture pressed again, the alcohol is distilled off, the oil allowed to settle, and filtered after a fortnight. One oer (2 lb) of seed furnishes 11 fluid ounces of oil, six by the first process, five by the second. The oil is well known for its medicinal properties—*Amie Mat Med Reale Mater. Med* p 553 *Roxb* in 682, *Voyt* 186 *O'Shaughnessy Lindley J. Med* p 181 *Jur Rep Ex.* 1862 *Eng Corp Cal Cat. Ex* 1862

**CROTON VARIEGATUM** An ornamental shrub commonly called the laurel, the leaves are variegated and it is very commonly grown in pots. There is a willow leaf variety equally ornamental and handsome, the plants thrive best in large pots or tubs, and are easily propagated by cuttings. The willow leaf variety thrives best in a situation shaded from the noon day sun—*Jaffrey Graham Thomson's Records of General Science*, Vol IV, p 114

**CROW.** Several species of crows inhabit the south and east of Asia, and will be found noticed under the genus *Corvus*. *Corvus toma semodius*, Rational Crows, of the Subfamily *Glancopinae*, inhabit the northern region of Nepal and in Celebes, and on the Malabar Coast, black and white crows occur, also occasional albinos. The crow is reckoned a bird of ill-omen in India, still Malabar females are sometimes named Kaka, the name in that dialect, as well as in Sanskrit, for the crow. The females of Malabar are, more than others, called after animals. Mani, the crocodile, is a name among them. In christian countries, Barbara, Ursula, barbarian and little bear, are not unusual. Vultures and crows are permanently resident in India, and the crows incubate chiefly in March and April, their nests being not unfrequently exposed to the fury of the non-westerns, and destroyed by them altogether. In winter, many birds, crows, starlings, finches, larks, parrots, a few thrushes, pigeons, rock pigeons, cranes, ducks, flamingoes and pelicans, assemble in large flocks. The common crow of India is of unwonted famili-

arity, impudence, and matchless audacity. Mr Sirr mentions a crow seizing bread from a toist rack, and another taking food from a dog while eating. Sir James C Tennent mentions that, on one occasion, a nurse seated in a garden adjoining a regimental mess-room, was terrified by seeing a bloody clasp knife drop from the air at her feet, but the mystery was explained on learning that a crow, which had been watching a cook chopping mince-meat, had seized the moment when his head was turned to carry off the knife. He adds that one of these ingenious marauders, after vainly attitudinizing in front of a chained watch-dog, that was lazily gnawing a bone, and after fruitlessly endeavouring to divert his attention by dancing before him, with head awry and eye askance, at length flew away for a moment, and returned bringing a companion, which perched itself on a branch a few yards in the rear. The crow's grimaces were now actively renewed, but with no better success, till its confederate, poising itself on its wings, descended with the utmost velocity, striking the dog upon the spine with all the force of its strong beak. The ruse was successful, the dog started with surprise and pain, but not quickly enough to seize his assailant, whilst the bone he had been gnawing was snatched away by the first crow the instant his head was turned. Two well-authenticated instances of the recurrence of this device came within his knowledge at Colombo, and attest the sagacity and powers of communication and combination possessed by these astute and courageous birds. The *Corvus culminatus*, or large black crow of India, may be constantly observed wherever there are buffaloes, perched on their backs, and engaged, in company with the small Minah, (*Acridotheres tristis*), in freeing them from ticks—*Tennent's Sketches of the Natural History of Ceylon*, p. 253. *Sirr's Ceylon* See *Corvidæ*, Birds.

**CRUSADE** At the time of the first crusade, the mahomedan power was shared between those of Arab and those of Mongol origin. The Arab movement had been stayed by their defeat by Charles Martel, on the banks of the river Loire, and they had settled down in the countries which they had conquered, advancing in civilization and cultivating science. But later, the fresh converts to mahomedanism, the Seljukian Turks and Tatars, issued from Central Asia, carrying ruin in their path. Asia Minor was lost to the Greek empire, and Constantinople itself imperilled, when Peter the Hermit roused christian Europe to recover the Holy Sepulchre at Jerusalem. It was, subsequently, in 1187, lost again by the conquest of Salah-ud-din, and at the time that St Louis of France took the cross, Chengiz Khan with his followers had so ruined the whole tract from the Caspian to the Indus, that the succeeding centuries have not sufficed to restore it. The right wing of this enormous host was bringing ruin on the Slav nations of Eastern Europe, while its left wing was menacing Baghdad and Syria. Poland and Hungary were invaded in 1258, and they had entered Bohemia and Moravia. Frederic II, in 1229, after Salah-ud-din's death, recovered the Holy City, but it was again finally lost to the Kharismanian Turks, who destroyed every christian whom they found. Not long after, the christians were again defeated at the battle of Gaza, which was fought in company with Mahk-Mansur, the ruler of Damascus, against the king of Egypt. St Louis made two crusades, in the first of which he was completely defeated. The Eyubi are descendants of Salah-ud-din, the Saladin of the Crusaders. The family are known as the Hassan Keif, and occupy the district of Shirwan. In Mr Rieh's time, the bey was powerful and independent. See Acre, Kafia.

**CRUSTACEA**, are the Crustaces of the

French, and the Krustentheire of the Germans. The common crab, the lobster, and eayfish, the common shrimp and the water-flea, may be taken as types of different sections of this family.

Cancer, is a genus of Short-Tailed Crustacea, the type of the family Canceridæ of Linnaeus, and includes a large number of species of the genus Cancer, and the term Crab, which is a translation of it, is in common parlance applied to the great bulk of the Braehyurous Crustaceans. Dr Leach restricted the genus Cancer to the form of *Cancer pagurus*, *Linn*, the large eatable Crab of British coasts, which was, when he defined the genus, the only species known. For the Blood spotted Crab of the Asiatic seas (*Cancer maculatus* *Linn* &c), and the Coralline Crab (*Cancer corallinus* *Fabr*), Dr Leach instituted the genus *Carpilius*, characterised by the existence of a single tooth on the border of the carapace and by the tridentated front, and, for the "eleven toothed crab" (*Cancer undecimdentatus* *Fabr*) *Egeria* is a genus of Braehyurous decapod Crustaceans established by Dr Leach. *E. Indica*, in size, general form of the body and length of the feet, bears a great resemblance to *Inachus scorio*, but besides generic differences, the limbs are rather short and slender. It inhabits the Indian seas. The hermit crabs are very common, and the nimble little Calling Crabs, *Gelasimus tetragonus*? *Edw*, & *annulipes*, *Edw*, & *Dussumieri*? *Edw*, scamper over the moist sands, carrying aloft their enormous hand, sometimes larger than the rest of the body.

The place of the crabs amongst the crustaceans well defined and of the genera and eastern species are — 1 *Æthra*, 15 *Cancer*, 4 *Carpilius*, 5 *Zozymus*, 1 *Lagostoma*, 27 *Xantho*, 7 *Chlorodius*, 3 *Panopeus*, 4 *Ozius*, 4 *Pseudocarcinus*, 4 *Etisus*, 2 *Platycaremus*, 4 *Pilumnus*, 3 *Ruppellia*, 1 *Pirimela*, 3 *Eriphia*, *Trapizia*, 1 *Mela*, 1 *Carcinus*, 4 *Platyonichus*, 1 *Polybius*, 12 *Portunus*, 13 *Lupea*, 10 *Thalamita*, 1 *Podophthalmus*.

5 Limulus

**CRUST'HA** Of the race of Crust'ha, are Kansa, prince of Mathura, the fifty-ninth, and his cousin Cishna, the fifty-eighth, from Budd'ha, while, of the line of Poorn, descending through Ujmda and Deomda, are Sul, Jaiasandha and Yoodishtra, the fifty-first, fifty-third, and fifty-fourth, respectively — *T'od*

**CRUTTENDEN**, G S J, an officer of the Indian Navy, author of a Report on the Mijjar-thez tribe of Somali, inhabiting the district forming the N E point of Africa, also, of a Memoir on the Western and Eastern tribes inhabiting the Somali coast of N E Africa, also of a Journal of an excursion to Sanaa the capital of Yemen — *Geo Trans* 1844 — 1846, vol VII 3 *Bom Geo Trans* 1847 — 1849, vol VIII p 177 *Ibid* vol II 39

**CRUZCOOL** An opening or strait separating Miscal Island from the Chittagong coast, north of the White Sand Cliffs which are in lat 21° 17' N to 21° 24' N — *Horsh*

**CRYPSEIRHINA VARIANS**, a curious bronze coloured magpie, common to Siam and Java. *C. varians* is the *Phrenotria tenuis*, *Horsh*, and seems to be of common occurrence in the Tenisserim provinces, where its presence was first remarked by the late Dr Helfer — *Wallace Blyth*

**CRYPTOCARYA**, a genus of plants, all of them trees, of the Nat Order Lauraceæ, of which the following may be named

- C. amygdala*, Nees of Patgong
- C. floribunda*, Nees of Silhet
- C. Griffithiana*
- C. membranacea*, Thw of Saffragam, Ceylon
- C. Wightiana*, Thw of Ceylon *Vogt*

**CRYPTOCARYA WIGHTIANA** Thw  
*C. floribunda* Wight | Goloo mor gass SINGH  
A large tree of Ceylon and the Peninsula — *Vogt Thw Wight Ic*

**CRYPTOCHILUS SANGUINEA** a plant of Nepal, one of the Orchidaceæ

**CRYPTOGAMIC PLANTS** From the Lichen tribe, from the Algæ, fungi, mosses and ferns, man derives nutriment and valuable products. Some of the Cryptogamic plants form considerable article of commerce, particularly as food plants, affording gelatinous and amylaceous matter, and being useful in medicine and the arts — *Simmonds*. **CRYPTOLEPIS** A genus of plants belonging to the nat order Aselepiaceæ. *C. elegans*, *C. grandiflora*, *C. pauciflora*, and *C. reticulata*, *W Ic Vogt*.

**CRYPTOLOPHIA**, a genus of birds of the family Tachitreadæ, in which are 6 gen 12 sp, viz 3 Tachitrea, 2 Philentoma, 1 Rhipidura, 4 Leucocerca, 1 Myagia, 1 Cryptolophia. See Birds, page 503

**CRYPTOMERIA JAPONICA**, D Don.

*Cupressus Japonica*, *Thunb*

The Japan Cedar, a beautiful and greatly

admired tree, is a species of pine, not unlike the Araucaria of Norfolk Islands and Brazil. When growing luxuriantly, it is highly ornamental, rising from the ground as straight as a larch, and sending out numerous side branches almost horizontally from the main stem, which again droop towards the ground in a graceful and "weeping" manner. The wood of the tree has a kind of twisted grain, and possesses great strength and durability. It is highly valued by the Chinese and, from its beauty and straightness, is often used by the Mandarins and priests for the long poles which are generally seen in front of their houses and temples. It is also well known and highly prized by the natives of Japan as an ornamental tree. It is a most conspicuous tree evidently in high favour with the priests of Buddha, and well deserves to be so. It succeeds admirably in China, and has been introduced into England, where it is admired — *Fortune's Wanderings*, page 128, *Fortune's Tea Districts*, pages 16, 212, 304

Palay **MALEAL TAN** | Large flowered Cryptostegia

A climbing plant belonging to the family Asclepiadaceæ is common in the south of India, and found in abundance in some places, yields a fine silky fibre, capable of being spun into fine yarn, and of employment for many of the purposes to which flax is applicable, suited to the weaving of different qualities of cloths. Palay fibre seems to be a good substitute for flax, as it is soft, pliant and susceptible of being split into the finest threads. The stalk contains a large per centage of fibre, besides yielding a milky juice which solidifies into a gum elastic of the nature of India rubber. Samples of the concrete juice were sent to the Madras Exhibition from Nellore, from Masulipatam, from Cuddapah and from Madras. The milky juice has long been known to contain caoutchouc, but it has not as yet been collected for the purposes of commerce, and it is doubtful if a sufficient quantity could be obtained to render it an article of trade. The small samples forwarded appeared to be of excellent quality and answered well for rubbing out pencil marks from paper. Mr Underwood made a fair attempt at producing waterproof cloth by simply run-

ming the juice over the cloth, which received Honorable Mention—*M E J R*

**CRYPTOTHELEA CONSORTA.** Wood Moth

### CRYSTAL

Koreh HEB | Balur HIND PRS

The crystal alluded to in Genesis xxxi 40 as ice, and in Job vi, 16 as frost and the Hind Pers word Balur, seem to be applied indifferently to ice and rock crystal. Rock crystal occurs abundantly in many parts of India, and that of the south of the Peninsula is known as Vellum stone, from the place of its occurrence. It is said that rock crystal can be dyed. If made red hot, and plunged repeatedly into the tincture of cochineal, it becomes a ruby, if into a tincture of Red Sandal, it takes a deep red tint, into tincture of saffron, a yellow like the topaz, into a tincture of turnesol, a yellow like the topaz, into juice of Nerpium, it takes a deep violet like the amethyst, and into a mixture of tincture of turnesol and saffron, it becomes an imitation of the emerald. Steeping the crystal in oil of turpentine, saturated with verdigris or sprits of wine, holding dragons blood or other coloured resins in solution, depth of tints are produced proportioned to the time of steeping. Crystals can be colored if heated in a crucible with orpiment and arsenic. Crystal coloured red are false rubies known in France as Rubaces—*King* p 178 See Cambay

**CSHATRYAS.** See Chatrya, Hindn

**CSHITIJA (CACSHA),** SANSK The horizon, also, the sine of an arc referred to the horizon, used for finding the ascensional difference—*Capt Ed Warren, Kala Sankhita*, p 94, 98, 105

**CSOMA DE KOROS, ALEXANDER** a Hungarian philologist, who resided long at Ladak and Kanum studying the Tibetan language. He died in 1842 on the Himalayas. A Memoir of him, appeared in the *Bl As Trans* 1841. He bequeathed Rs 5,000 to the Asiatic Society of Bengal. He resided in Kunawar, and on the frontier, from 1828, for the sake of studying the language of the country. An account of Gerard's interview with him appeared in the *Gleanings in Science*, 1829, vol I 110. He wrote a Geographical notice of Thibet in *Bl As Trans* 1833 vol I 121.

The Buddhist religious works of Tibet brought to notice by Alexander Csoma de Koros, are the Kanjui, which consists in its different editions of 100, 102 and 108 folio volumes, and comprises 1083 distinct works. The Tanjui, consists of 225 volumes folio, each weighing from 4 to 5 pounds in the edition of Peking, but an edition has also been published at Lhasa, and other places of these De

Koros gave an analysis in the 20th volume of the Asiatic Researches and died soon after See Pali

**CTENOID FISHES**, a great division of fishes, thus named by Agassiz, from the pectinated appearance of the rectral edges of the scales—*Enol Cyc* page 241 See Fishes

**CTESIAS** Of the history of Ctesias only a few fragments have been preserved, chiefly in the works of Diodorus Siculus and Photinus. He was a native of Cnidus, and was the Greek royal physician at the ancient Persian capital, where he arrived either as a prisoner or a traveller. Being skilled in medicine, he was taken into favour by the king, and remained seventeen years at his court, where he was treated with great distinction. During his residence in Persia he was able to consult the public archives, and he compiled from them a history of the Persians, and of their predecessors in the empire of Asia. He also wrote an account of India and its productions, but the absurd exaggerations and fables which this contains have caused all his other works to be viewed with suspicion. He is likewise accused of being led, by extreme jealousy of Herodotus, into direct mis-statements, that he might contradict that historian. Aristotle, more than once, declares him to be unworthy of credit, and modern critics have generally agreed to reject altogether, or to receive with great reserve, all his assertions. Yet Diodorus Siculus and several ancient authors, appear to have followed and trusted him, and it may be observed, that whilst mere travellers' tales and vulgar traditions were probably the only sources of his Indian marvels, written records and monuments may have furnished him with well-authenticated historical facts, to assist him in compiling the history of the country in which he resided, and of which he had a personal knowledge. Unfortunately, of his history very little remains, except the names of kings. Much relating to Assyria contained in the works of others was, however, undoubtedly copied from him. Ctesias and Isadore both mention a statue pillar of Semuamis at Bap-tane, but these and the Syriac inscriptions have disappeared. Ctesias mentions the use of swords as lightning conductors. The date of Ctesias is about B C 400, Onesicritus was an officer of Alexander's army (d B C 328) *Smith's Dictionary of Gr and Rom Yule Cathay* I p xxxix *Layard Nineveh* Vol I p xv) See Lightning conductors

**C'TESIPHON** The Babylonian empire was subverted by Cyrus, who took the capital, by turning the course of the Euphrates and marching his troops along the bed of the river into the centre of the city. The walls

and temple of Belus are said to have been demolished by Xerxes, on his return from the Grecian expedition, but this could not have been the case, as they were still standing in the time of Alexander. After the building of Seleucia and Ctesiphon, Babylon became gradually deserted, and we learn from St Jerome that the space within the walls was converted by the Parthian kings into a royal hunting park. From this period we cease to hear of Babylon as a city, but notwithstanding so many ages of barbarism and ignorance have passed away, tradition still continues to identify both its name and situation. The town of Hilleh is said, by the people of the country, to be built on the site of Babel, and some gigantic ruins still to be seen in its vicinity, are believed to be remains of that ancient metropolis. Porter remarks that when we consider that so many centuries have passed since Babylon became a deserted habitation, and that it yet lay in the neighbourhood of populous nations, our surprise ought to be, not that we find so little of its remains, but that we see so much. From her fallen towers have arisen, not only all the present cities in her vicinity, but others which, like her self, are long ago gone down into the dust. Since the days of Alexander, we find four capitals, at least, built out of her remains: Seleucia by the Greeks, Ctesiphon by the Parthians, Al Modam by the Persians, and Kufa by the Caliphs, with towns, villages, and caravansaries without number. Ctesiphon was carried by the Parthians out of the ruins of Babylon. Its ruins are to be seen on the eastern shore of the Tigris, eighteen miles south of Bagdad, and immediately opposite to it, the ramparts and fosse of the Grecian city of Seleucia, which afterwards becoming identified with the former, under the name of Coche, they assumed, when thus united, the epithet of Al Modam, or the cities. Ctesiphon was most admirably situated on a sort of peninsula formed by a sudden flexure of the Tigris which must have embraced the greatest part of the town. Its foundation, however, can hardly be ascribed to any particular person, as it would seem to have increased gradually during a succession of many years, from a camp to a city. Pacoras, supposed to be Ordes, king of the Parthians, and contemporary with Anthony, is thought to be the first who surrounded it with walls, and made it the capital of the Parthian empire. It was sacked, together with Seleucia, by the generals of Marcus Aurelius, A D 165, and afterwards by the emperor Severus. It became the favourite winter residence of the powerful successors of Artaxerxes, from whom it was taken by Said, the general of the kalif Omai, A D

637. The sack of Ctesiphon was followed by its gradual decay, and little now remains, but part of the palace of Chosroes (called Tak-i-Kesra, the arch of Chosroes) a melancholy emblem of the glory of its master. It is seen from afar on the plain, and presents a front of three hundred feet in length by one hundred and sixty in depth, having in its centre a vaulted hall, a hundred and six feet in height to the top of the arch, the span of which is eighty five. The Ali Capı at Ispahan and gates of the palace of Delhi, sink into insignificance beside the Tak-i-Kesra. The city walls, which appear to have been of very great thickness, may also be traced to a considerable distance on both banks of the river. The names of Seleucia and Ctesiphon are very frequently confounded by the early Christian writers, but the cities stood on opposite sides of the river Tigris, and were built at different periods.—*Layard Nineveh, Vol I p 242. Kinnear's Geographical Memoir, p 253-54, 273, 274. Porter's Travels J B Frazer's Travels, p 3. See Enphrates Kalneh Kasr Kesra Seleucia Tigris.*

CUBAB CHINI *HIND Piper eubeba*, Cnebebs, properly Kabab Chini

CUBBON Sir Mark, one of India's able and distinguished statesmen. He landed at Madras about A D 1800, and acquired his first knowledge of India under his uncle, Sir Mark Wilks, then Resident at Mysore. He succeeded his intimate friend Sir William Morrison as Commissary-General in 1827, and in 1834, was selected by Lord William Bentinck to succeed that officer and his colleague, Mr Macleod, as sole commissioner for Mysore, and the principality of Coorg in the capture of which he had share. was shortly afterwards added to his charge. Sir Mark Cubbon had here the administration of a Native State preserving its native institutions, but guided and directed by British officers. This problem has since been followed in the Punjab, and has stood the stern trial. The Mysore country had been exhausted by insurrection, famine, and misrule, on the rajah, but Sir Mark Cubbon's wise and vigorous career established the value of principle of government embodied in Mysore system. He died at Suez, on his way to Britain, and was buried in the parish of Manghold, Isle of Man.—*Mona's History May 22. Selections from the Records of Government of India, Foreign Department No 11, Census of the Punjab, and Administration of Mysore.*

The Cubeb pepper, as it appears in commerce, is stated to be the fruits of two different species of Piper, the Piper cubeba and P. caricum, both of them natives of Java, to which island their cultivation appears to be confined. In the Javanese language its name is Kumunkus, and this is its only specific one, for the Malay name lada barekor, meaning "tailed pepper," is a factitious one derived from the appearance of the dried fruit, which has always the foot-stalk adhering to it. The fruit of Piper cubeba, when ground, should afford 10 per 100 of essential oil, on distillation with water — *Irvine, Crawford's Dict* page 117

CUBE SPAR, or crystalline carbonate of lime, of good quality, occurs in Nellore, Kurnool and Cuddapah. It is used in tin plates for mounting microscopic objects and as a source of very pure lime. Rhomb spar or Dolomite spar also occurs in Cuddapah.

CUBIT. *Hath.* HIND. A measure of length, from the point of the elbow to the point of the middle finger. The Egyptians made use of the cubit measure divided into six hand-breadths, or twenty-four fingers, and also of the royal cubit, which consisted of this lesser cubit and a hand-breadth over. The royal cubit contained twenty English inches, and two-thirds. The Jews made use of the same measure for length of a cubit and a hand-breadth. The Egyptians measured longer distances by the Schœnus of about six miles in length. Land was measured by the aroua or half acre, which, if square, measured a hundred cubits on each side. That a measure nearly the same was in use from the earliest times we learn from the size of the pyramids. Exactly such was the cubit used in making the five smaller pyramids of Gezeh — *Egypt Inscript 2nd Series, pl 46* *Ezekie ch XI, 5* *Herodotus, lib, II 163* *Vyse's Pyramids in Sharpe's History of Egypt Vol I, 167*

CUBYA KANYA, from Cubja (the spine) of the vulva (Kanya).

CUCHOURA. A small rajpoot clan, of which there are a few in Goruckpoor — *Elliot*

CUCHWAHA, properly Cushwaha, be-

ing descended from Cush or Kusha, the eldest son of Rama. This is a celebrated rajput tribe. The rana of Amber is of the race who claim descent from Cush, second son of Rama, king of Ayodhya, who migrated and built the fort of Rotas, on the Sone. Authentic history commences in A D 294 with raja Nola, who founded Narwaz or Nishidr Amber or Dundhwar, the early capital of Jeypore, was built by Jey Singh, and was a city of great architectural beauty. According to Tod, Amber gave its name to a rajpoot dynasty of the Soorya Vansa race, a scion of Nirwar — *Tod, Thomas' Prinsep's Antiquities, p. 259 Elliot Supp Gloss*

CUCIFERA THEBAICA

Doom tree | *Hyphæne coriacea Gert*  
Gingerbread tree

The *Hyphæne* exclusively inhabit Upper Egypt, especially the neighbourhood of Thebes, whence it is named *Cucifera thebaica*. Clumps of it occur near Thebes. Its stem, instead of growing without branches like other palms, forks two or three times, thus assuming the appearance of a *Pandanus*. The fruit is about the size of an orange, angular, irregularly formed, of a reddish colour, and has a spongy, tasteless, but nutritious rind. The albumen of the seed is hard and semi-transparent, and is turned into beads and other little ornaments. Its brown mealy rind resembles gingerbread — *Eng Cyc p 385*

## CUCKOW

Koel. HIND. | *Sacrip* HLB

*Cuculus canorus*, is the European Cuckoo, of Europe, Asia, Africa, Malay countries, and common in the Himalaya, visiting the plains during the cold season. The Indian cuckows are the noisy koel, remarkable for the dissimilar sexes, and for parasitically laying in the nests of the crow. The Coucol, or Crow-Pheasant, is another noisy and conspicuous bird wherever there is a little jungle, the European Cuckoo will now and then turn up, more frequently in the barred plumage of immaturity. Amongst the birds of Tenasserim is a Cuckow, intermediate in size to *C. micropterus* and *C. poliocephalus*, and according best with Mr. Hodgson's *C. saturatus*, which differs from *C. micropterus*, *Gould*, chiefly in its smaller bill, like that of *C. canorus*, if it be not, indeed, the veritable *C. micropterus* of *Gould*. *Mr Blyth's Report* See Birds, Coel, *Cuculidæ*, *Cuculuo*, Kameri, Koel

**CUCUBALUS DRABA**, *Gartner* A plant of the Alpine vegetation of Kedarnath — *Hofmeister Travels*

**CUCULIDE** the Cuckow-Tribe, or Cuckows, a family of Seasonal Birds, placed by Cuvier and Lesson next to the Winyeeks, Yunt. Among the birds of Tenasserim is a Cuckow, intermediate in size to *C microp* terns, and *C. poliocephalus*, and according best with Mr. Hodgson's *C saturatus*, which differs from *C. micropterus*, *Gould*, chiefly in its smaller bill, like that of *C. emorus*, if it be not, indeed, the veritable *C. micropterus* of *Gould*

#### CUCUMBER

*K. schen* *Armen* *Khadra* *Hind*  
*Kusya* *Arab*

The cucumber is grown from seed at all seasons. The plants should never be too close. It thrives in all parts of India, and grows with much or little water. And if allowed to climb over sticks or trellis work, is out of the way of jackals and porcupines, who are fond of the fruit. The natives grow them in their fields, in the cold season, amongst grain of various sorts, and in the sandy beds of rivers during the hot weather. The cucumber of Numbers 31 14 is the *Cucumis melo*, the melon — *Jaffrey*. See *Cucumis*

**CUCUMBER, CLIMBING INDIAN**

-------	------	-------	------

This plant furnishes the colocynth of the European pharmacopæia. It grows abundantly in most of the arid sandy tracts of the Punjab, from Delhi up to Peshawar, on the Coromandel coast, at Kaira in Guzerat, Tihut, the Doab, in the deserts by the Jordan and near Sinai, in Turkey and in Nubia. The fruit is about the size of an orange, smooth, and yellow. When ripe it is peeled, and dried in a stove when it becomes whitish, very dry, and spongy, in this state it is met with in commerce. It is odorless, but has an extremely bitter nauseous taste and a disagreeable smell. The plum and seed, produce exceedingly powerful cathartic and emetic effects, and an extract is used in medicine. The fresh root is used as a tooth brush, and dried and powdered is given as a purgative. — *Dr J L Stewart, Royle Pharmacopæia*. *O'Shaughnessy, Cyc* p 252 *Irvine Med Top*. 209 *Bellew*

The native country of this valuable plant is unknown. Linnæus says Tartary, but he does

not give his authority De Candolle says Asia, Roxburgh only knew it in a cultivated state in tropical India, and Professor Royle seems unacquainted with any wild station for it in the Himalaya regions. It is cultivated in Persia and Afghanistan, the Punjab, and all over India. From time immemorial Cashmir has been famous for the excellence and abundance of its melons, which form a staple article of the food of the inhabitants, and the melons of Multan and Jhung are excellent. Dr J. L. Stewart says that this celebrated fruit rapidly degenerates if sown in the plains. In Kabul it thrives and is in perfection in October and November, when the first frost touches the plant. It is largely taken for sale to the city of Peshawar—*Roxb* in 720 *Voigt* 58 *Eng Cyc* p 252 *Dr. J. L. Stewart*, p 96

The Oil

Kanluri ka bung ka-tel Di	Oil of Cucumber
Velliveri yamay	TAM
	TIL

This is commonly grown and largely used all over India, but most Europeans find it difficult to digest. Cucumbers, of the *C. sativus* and *utilissimus*, are consumed in immense quantities by the Karens and Burmans, who seem to prefer them large and yellow, rather than pluck them, when green and tender.

The seeds of this and of *C. utilissimus* are officinal, being considered cooling. This may be the Bilam khura, or hill cucumber mentioned by Lowther—*Mr Jaffrey Dr. Roxb* in 720 *Voigt* 59 *J. L. Stewart*, p 97, and *Mason*

**CUCUMIS TUBEROSUS** *HIND*

Adulay Kai	TAM	Chura Kai	TIL
Nellay piku	"		

This is a pot vegetable not much in request, but it is eaten by the common people, who make it into curry. It grows wild in cotton soils of north Tinnevely. It is very prolific, and on waste lands, headlands &c, in great abundance. A cooly load of tuber gives six large measures of fine flour, considered by the natives who use it as a most excellent bread stuff. One measure of the flour is considered equal to two measures of the Pannam glossanum, which latter is the staple food of North Tinnevely. The mode of preparing the flour is simple. The tubers are washed and peeled, then reduced to a bruised mass on a rough stone, after which it is washed precisely like arrowroot, the washing extending over seven or eight days, when the starch is dried in the sun. The flour is almost as white as arrowroot, it is reduced to congee quite as easily, by pouring boiling water upon a spoonful or two which has been first moistened with cold water. The root is not generally known to the natives, but the fruit, a small capsule used in sweetmeats, is known to them as the Adully. It yields a pure starch, and as a means of supporting life, merely, it is probably as valuable as arrowroot, sago, tapioca, or any other starch. The ultimate dietetical action of all starches is the same, and the preference given to arrowroot is due to its flavour alone. This one makes a good jelly, but it smells and tastes slightly of linseed oil, and leaves a faint bitter taste upon the palate, and unless this be due to want of care in its preparation and can be got rid of, it would not be acceptable.

to Europeans. As to the nutritious quality of starch, modern research has shown it to be deficient in flesh producing properties, and that it can only be called strengthening when mixed, as it usually is with milk, or flour containing gluten. It would therefore appear to be a mistake to suppose that as an article of diet it can be equal to twice the quantity of flour of *Panicum grossum*, which, in all probability, besides its starch, contains a considerable quantity of gluten. The starch granules in *C. tuberosa* are compound, and they have in consequence a very different shape from the various arrowroot starches from which they can be easily distinguished with the microscope. They vary much in size, the smaller having a diameter less than 1-11,000ths of an inch. They are spheroidal, and the usual black ones are compound granules of 1-5,000ths of an inch in diameter. — *Roth Am bot*, p. 336. *Reichb. Bot. t. 1. Kear's Monograph* p. 66. *Captain J. Mitchell, Officer in charge of the Great East African Mail from Harar to Zanzibar* p. 58. *Proceedings*, April 1862.

**CUCUMIS TURBINATUS**, *C. trigonus* and *C. acutifolia*, are plants of Bengal and peninsular India. — *Roth* in 723.

#### CUCUMIS USTATA

*Velutaria* L., *Tan* | *Dosa* Kan. *Tri*

Cucumber is commonly cultivated by the natives and eaten when ripe as a dessert. *Cucumis sativus* and *utilissimus* are also cultivated to a great extent and generally eaten green, without any preparation whatever. The country cucumber is very bitter at both ends, and these should be cut off before preparing for salad. To the people this is a valuable fruit. — *Toffrey*. See Vegetables of Southern India.

Cultivated throughout India and to a considerable elevation in the Punjab. Dr Stewart has seen it at 6,000 feet, on the Ravi, in the hills. This gourd attains 2 or 2½ feet, and is stated to reach the extraordinary length of 5 feet. When ripe, if carefully gathered and suspended, it will keep good for several months, from which circumstance they are valuable for long voyages. It is pickled when half grown. The seeds, like those of the other cucurbitaceous fruits, contain much farinaceous matter blended with a large portion of mild oil, the natives dry and grind them into a meal, which they employ as an article of diet, they also express a mild

oil from them, which they use in food and to burn in their lamps. Experiments, as well as analogy, prove these seeds to be highly nourishing and well deserving of a more extensive culture than is bestowed on them at present. The powder of the toasted seeds mixed with sugar is said to be a powerful diuretic, and serviceable in promoting the passage of sand or gravel. In Roxburgh's time, this agriculture was chiefly confined to the Guntoor Circar, where these seeds formed a considerable branch of commerce. — *Roxburgh's Flora Indica*, Vol. in pp. 721-22. *Cal. Ex* 1862. *Humboldt*, in p. 265. *Dr Stewart*, p. 97. *Forst* p. 58. *O'Shaughnessy*, p. 343. *Engl* p. 252.

**CUCURBITACEÆ**. A natural order of climbing or creeping plants, the Gourd tribe, chiefly natives of hot countries, ranged by Meisner under 35, and by Endlicher under 28 genera. Of these there occur in Egypt, Abyssinia and Arabia 8, in Astracan and Persia and the Levant 3, in China and Japan 5, and in the East Indies 160 species, of which 46 are natives of India.

<i>Achimandra</i>	4	<i>Karira</i>	2

<i>Erithropalum</i>	1	<i>Tichosanthus</i>	25
<i>Herpospermum</i>	1	<i>Z. huera</i>	2
<i>Gymnopetalum</i>	2		

Some of the species afford cathartics of remarkable power, others have useful edible fruits. The fruit varies much in size, form, and external characters, but is generally fleshy within, and its pulp is often so saturated with water that it cannot be dried. The roots of most of the order contain starch, often associated with an acrid poisonous matter, which can be separated by washing the powdered root with water, in which the acrid matter dissolves, while the starch is left. The seeds of most of the order are of a mild sweet taste, give good emulsions with water, and yield a fixed oil by expression. Few of the plants of this order are indigenous in Europe. In tropical countries this order gives the inhabitants a large portion of their food, which it often affords of the finest quality in the most arid deserts or on barren swamps and islands. In Persia, China and Cashmere, they are cultivated on the lakes, on the floating collections of weeds common in these localities, in India, they are very abundant, either in the wild or cultivated state. According to Dr Hunter the *Cucurbitaceæ* abound in fibres of great

length The following is a list of the chief dietetical species

—Royle, p 219 O'Shaughnessy, p 351.

CUCURBITA, a genus of the Cucurbitaceæ, has six species, but only four have been cultivated, viz C maxima, C ovifera and C pepo, which include all pumpkins, gourds, squashes and vegetable marrow, and C moschata, the water melon. Of these, there are innumerable varieties. The Burmese names for species are Boo kha, Thaka hai Sgau, Thai than Sgau. A number of melon, cucumber and "kadu" seeds are included among oil seeds, on account of their yielding oil — *Darwin Mason Powell*

CUCURBITA ALBA Roxb syn of Benincasa cerifera, *Savi*

CUCURBITA AURANTIA, the Orange-Gourd, is rather more tender than the other species — *Engl Cyc* p 253

CUCURBITA CERIFERA Fish syn of Cucumis citrullus, *Serr*

In India, the water melon is cultivated in river beds and in alluvial deposits of lakes, tanks, &c, where abundance of water can be had, it is used as a dessert. It is generally considered to be the melon of the Jews, mentioned in many parts of the Bible. The juice of this fruit is very cooling, and is said to do well for a cooling drink in typhus fever — *Powell Panj Prod Eng Cyc* p 253 *Jaffrey* See Vegetables of Southern India.

Several varieties of this are largely cultivated in India and are eaten dressed in different ways. The long white gourds are hollowed out and made into buoys for rafts for crossing rivers. The large round kind are used for making a kind of stringed instrument like a "sitar", called in Tamul Kinnayri, and are hence termed Kinnayri Chooraykai. A longer and narrow sort are employed in making the wind instruments called in Tamul Maghad with which the snake men (Pamoo Poodarer, Tam) entice snakes from their holes. In China the dried bottle-gourds are tied to the backs of children on board the boats to assist them in floating if they should unluckily fall overboard. The dried outer rind of the fruit is hard, and is used as a bottle called the fakir's bottle. A wild variety Tita-Laoo, is poisonous — *Vogt Ainslie's Materia Medica*, p 172, 238.

CUCURBITA LOBATA

Tinda, PUNJAB

In the Punjab this is a small round gourd when young, at which time it makes a most delicious vegetable for the table. The fruit is not bigger than a small turnip — *Powell Hand Book*

CUDBEAR, is a powder procured from the Lichen tartaricus, a plant found in Iceland, used in dyeing violet, purple, or crimson. Its colors are not durable when it is employed alone, and it is therefore used as a body to other expensive dyes, as indigo, cochineal, &c, making them more lively. It is used but little by the Chinese, and the demand in that market is not great — *Compendious Description*. See Dyes.

CUDDALORE, a town on the Malabar coast, in lat 11° 43' N, long 79° 50' E — *Horsburgh*

CUDDAM HIND Nauclea cadamba, properly Kaddamba.

CUDDAPAH, one of the two great collectorates (Bellary the other,) into which the Ceded Districts are divided. It lies between Lat 13° 5' and 16° 20' Long 77° 48' and 79° 50'. It is bounded on the north by part of the Kurnool country and the district of Guntoor, on the south by Mysore and North Arcot, on the west by Bellary and Kurnool, and on the east by Nellore and part of North Arcot. Of the great religious institutions in the south of India are Sri Sailam in Cuddapah, Conjeveiam, Chellambiam, Srangam, &c. There are also many religious edifices of great architectural merit, very worthy of being depicted and preserved for the beauty of their sculpture and elegance of their design, such as the stone mantapam in the fort at Vellore, lately used as an arsenal, the temples at Tanjore, Gangoudaram and Tribhuvanam, the ruins of Bijanagar, the pagodas at Leepich in Bellary, and of Tarpatty in Cuddapah, with many others equally worthy of admiration, in secluded and desert places, little known beyond their immediate neighbourhood, which would doubtless reward the institution of careful inquiries. Nearly all the finest buildings of early times have been constructed of stone, while the edifices erected within the past 500 years, comprising some of the most stupendous piles at present to be met with, are of brick. If the range of inquiry is extended to Hyderabad and Mysore, the list might be greatly extended. The Nizam's territories comprehend the

seats of some of the greatest and most powerful sovereignties of the Dekhan, such as Calyan, the capital of the Western Chalukya and Bijala raya dynasties, Devagiri, or Deoghur, the capital of the Yadava, Warangal that of the Kakateya, and the great mahomedan principalities of Gulbuigah, subsequently split into the subordinate powers of Bijapur the Adil Shahi, Ahmednagar Nizam Shahi, of Golconda Kutub Shahi, Berar Imad Shahi and of Bedar Birud Shahi, &c

The town of Cuddapah, in L 14° 28' 8" N, L 78° 48' E, is north-east of Madras, 364 feet above the sea. It gives its name to a revenue collectorate with a population of 1,451,921. Cuddapah town is situated in a fork of land about seven miles to the west from the union of the Nallamallai and Yellamallai ranges of hills. It has hilly and level lands, and much black soil suited for indigo and cotton growth, but few trees. The Pennar river flows through it. The soil is saline. Diamonds are washed for in its rivers.

CULLEN, General, of the Madras Artillery, long a Resident at the court of the rajah of Travancore, for half a century a distinguished contributor to physical science in India. Author of Geological features from Madras to Bellary, Mad. Lit Trans 1827, vol I, part I, 33. Account of the fall of rain at different stations on the Western Ghats, Rep Brit Ass 1844, 1846, vol II 23. On the influence of trees on climate Mad Lit Trans vol. XV, 450. He was an old and faithful soldier—one of the number who assisted the late East India Company in laying the foundations of an empire which has become the wonder of modern civilization. He was of the season of 1804. He served in the field at Candair and Berar in 1805 and 1806 with the Hyderabad Subsidiary Force, was in command of a brigade of 6 pounders with the 2nd Cavalry and 7th Regiment N I under Captain H. Scott at the surprise of a large

body of Mahrattas in December 1805, when four guns, with all their camp and baggage were captured. He was present at the attack and capture of St Denis, Isle of Mauritius and Bourbon in 1810, and with the force employed against Kurnool in 1815. He attained the rank of Colonel on 1st October 1842, and he died on the twentieth anniversary of this event. He was gazetted a Lieutenant General on the 11th November 1851. He was endowed with literary and political abilities of a very high order, and his diplomatic skill would have won undoubted laurels in a more stirring arena than Travancore, even in the most trying times. As a geologist and man of science he was favourably known to the scientific world, and the papers contributed by him to the journals of various learned societies have been among the most valuable and interesting that have appeared in those publications. He was a warm patron of science, and spared neither expense nor individual effort in promoting the cause, and advancing scientific investigations. He had been on the staff of Sir Frederick Adam, Governor of Madras, and subsequently Commissary General of the same Presidency. On the decease of Lieutenant Colonel T. Maclean, General Cullen was appointed Resident of Travancore and Cochin on the 8th September 1840, and retired on the 11th January 1860, so that he remained in office for nearly 20 years. His total period of service extended over 58 years and 8 months, spent in India, with the exception of a furlough of 3 years and one month to England. During his tenure of office as Resident, he succeeded in establishing the influence of the Government in the councils of the native states, on a solid and permanent basis, and never at any former period of our rule was British ascendancy in Travancore and Cochin greater than when he resigned his important charge into the hands of his successor. Born 17th May 1785. He died at Allepey on the 1st October 1862.

#### CULLENIA EXCELSA W. Ic

Durio Zeylanicus, Gardner

Kattoo-bodde SINGH | Malai koudi maram TAM  
Kattoo heriteya " |

A tree of the southern part of the peninsula of India, and common in the Central Province of Ceylon, at an elevation of from 2,000 to 5,000 feet. It is a very large and tall tree, trunk straight, from 60 to 80 feet high. Wood white, rather open grained, apparently not very good, but the outside wood only was examined. Under the microscope, its longitudinal section is very peculiar, altogether such as Dr Wright had not elsewhere observed. Dr Gibson had not met with this tree within the Bombay bounds—Dre,

Wright and Gibson *Tharates En Plant Zeyl*  
Part I p 28—9

**CULLEN'S LIQUID FOR PRESERVING WOOD** and iron is a mixture of coal tar, quick lime, and powdered charcoal, in the proportion of two measures (by bulk) of the tar, to one measure of the lime and one of the charcoal. Lime is freely dissolved in coal tar, with which it forms a cement which takes readily to wood, brick, iron, or other building materials however wet, and which sets with nearly the cohesion of mortar or hydraulic lime. With the addition of the charcoal, mixed in an exceedingly fine state, it is found that white ants, which attack and destroy creosoted wood, were effectually excluded, carbon, it appears, being especially poisonous to them. Six pieces of deal, or Himalaya pine, were buried in a place particularly infested with white ants, three of the pieces being protected by Cullen's preparation, and the three others being left in their natural state. At the end of five months, the blocks were dug up, when those which had been coated were found to be as sound as when put down, while those which had been left unprotected were found riddled with the perforations of the ants.

In the case of iron, creosote is believed to be a complete protection in ordinary soils, but in the saltpetre soil of the provinces of India, creosote is said to be of no use whatever. Six pieces of thin iron were buried, three being coated with Cullen's preparation, while the others were left as they were cut from the original plate, the coated iron was completely protected for the time tried, whereas the pieces put down in their ordinary state were found to have been much rusted.

**CUMBLI** GUZ HIND Kamli, also written Cinnul and Cinnal, and also called Camaline, is from the Sanscrit kamal, a blanket, a coarse woollen blanket worn universally by the peasantry of all India, and sold at Rs 1½ to Rs 100. Cumblies are woven in almost every district of India of the wool of the country, which is spun by hand. The yarn is sized with the juice of the common squill, the wool is beaten with a hand batten (in the way that sailors adopt in forming mats for protecting the rigging) no reed being used. A finer description of cumblie of which the sepoy cloaks were formerly made is manufactured at Bellary or in its neighbourhood. The Mysore cumblies are of superior quality, in black and white colours, and are sold at from Rupees 25 to 100 each, ordinary sizes 4 to 20 Rs.

each Bellary cumblies are well made, but are not of so high value as those of the Mysore District, they are 6 cubits long by 3. The cumblly is usually made in pieces of two or three feet broad, and five or six or more long, and generally very coarse, of a dark or black colour. Sometimes, however, they are manufactured larger, and finer, and striped, or spotted, black and white. There may be some connection between the Sanscrit word Kamal and the Grecian Chlamus, and the Latin Chlamys. It is barely possible also it may not be unconnected with the Arabic Kamis, from which we have the Italian Camicia, the Portuguese Camisa, and the French Chemise. The Chlamys was generally like the Cumul, made of wool, and in shape it was much the same, being half the breadth of its length. A similar connection may perhaps exist between the Persian and Hindee Suya, the Latin Sagum, and the modern Spanish Saja. Good cumuls are made in Ulwur and in the neighbourhood of Meerapur in Meerut. The Sansla Cumul of Meerat sometimes sells as high as twenty-five rupees. It is made of the wool of lambskins, shorn about three days after their birth.—*Elliot Supp Gloss Hindu Infanticide*, p 195

Cumin seeds, the fruits of *Cuminum cyminum*, are of an ash grey or light brown colour, oval linear, flat on one side, convex and striated on the other, aromatic, odour dependent on a volatile oil which is stored up in the seed-coat. Taste warm, bitterish, and aromatic, but not so agreeable as anise. The albumen is insipid. The plant is probably a native of Asia, and was made known to the Greeks from Egypt. It is extensively cultivated in the

East, but has long been introduced into the south of Europe, Sicily and Malta. This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 to 9,000 feet. Abundant in pasture, seeds, exported to the plains 16 cwts of the fruit yield about 41 lbs of the oil, which has a pale yellow colour and is limpid, of a disagreeable smell and acrid taste. Sp Gr 0.345. The seeds are used as a condiment in India, and the oil is used in medicine, it is a stimulant carminative. The seeds were formerly much employed as an external application in Emplastrum and Cataplasma Cuminum, and still by Jews in the process of circumcision. The seed is particularly prized by the mahomedans, who season their cakes with it. Dr Ainslie thought that much of what is used in Madras was brought from China, and from the Gulph of Persia.—*Dr Ainslie Mat Med* p 266 *Royle* 292 *Royle Stewart Mason Cleghorn O'Shaughnessy*, p 367. *Faulkner McCulloch*

CUND BARANGHI DUK See Gunta baringa

CUNEIFORM CHARACTER, also called the arrow-headed, also the wedge shaped character was used for the Bactro-Medo-Persian language of the dynasty of the Achæmenidæ. It was first observed at Be-satun, a little village at the foot of rocky mountains, which are covered with bas reliefs that were first decyphered by Burnouf and Lassen, afterwards by Rawlinson. The most important of the inscriptions is the list in the Naksh-e-Rustum of the Iranian nations subject to Darius, which the Persians attribute to the chisel of their famous sculptor Farhad. A descrip-

tion of them is to be found in Sir John Malcolm's Persia. Enormous marble capitals of columns are to be seen at Besitun. There are two tablets. The one containing a mutilated Greek inscription, declaring it to be the work of Gotaizes, the other a Persopolitan sculpture, adorned with nearly 1,000 lines of cuneiform writing, exhibiting the religious vows of Darius Hystaspes after his return from the destruction of Babylon, on the revolt of its usurper or governor, Nebukad-nazzar, the son of Nabonnet. Both Ctesias and Isodore mention a statue and pillar of Semiramis at Bapte, but the sculptures of Semiramis and the inscription in Syriac characters have wholly disappeared. Baghistan is traditionally described as the pleasure grounds of Semiramis. According to Sir H. Rawlinson—D'Anville first suggested the identity of Besitun with the Baghistane of the Greeks, and there are good grounds, from the ancient notices of this place, for supposing him to be correct. Etymologically considered the evidence is even more striking. To solve all difficulties it may, perhaps, be added, he admitted that the sculpture did really exist in the lower part of the rock, carved by the Assyrian queen, and that Khosroo Parvez, when he was preparing to make the carved surface the back wall of his palace, and for that purpose began to excavate deeper in the mountain, destroyed the sculptures, and removed all further trace of them. With regard to the pillar of Semiramis it is very curious that an Oriental writer of the 15th century should describe the rock of Besitun, from his own observation, as though it were sculptured in the form of a minaret, or minaret. Certainly nothing of the kind now remains. The cuneiform or wedge-like-writing sculptures that still exist, are supposed to record inscriptions of the times of Cyrus, Darius, Xerxes and Artaxerxes. They have been discovered on the solitary monument of Cyrus, on the Mughab, on the ruins of Persopolis, on the rocks of Besitun, near the frontiers of Media, and on the precipice of Van in Armenia. Grotefend in 1802 first ascertained that these were letters, and to be read from left to right, but Munter, Tyehsen, Burnouf, Lassen and Rawlinson, have laboured so that we now have translations, grammars and dictionaries. Their language is ancient Persian, before that of the Zend, which represents the Persian language previous to the time of Darius. The existence of bricks with cuneiform characters among the rivers of Balkh, General Ferrier says, had been remarked by previous travellers, and is of much interest, as he adds, no other similar relics are known so far to the east.

Sir Henry Rawlinson suggests that they may belong to the Kushan (a famous Scythian race) who held Balkh in remote antiquity, and whose bricks, stamped with cuneiform Scythian legends, are also found at Susa, and on the shores of the Persian Gulf. M. Ferrier found great numbers of baked bricks, nearly three feet long and four inches thick, scattered about the citadel of Furrah, an ancient town which was plundered by Chengis Khan. That their origin was certainly anterior to that of the town was plainly indicated by the inscriptions upon them, in the cuneiform character. The existence of bricks with cuneiform characters at Furrah is very important, and is not mentioned by any other traveller. The size of the bricks is also remarkable. The only place where bricks of so large a size have been found is in the kitchen of Sardapulus, at Calah or Nimrud. Bunsen says the first cuneiform character was Median or west Iranian, and is to be distinguished from the language of the Zend books, which is East Iranian or Old Bactrian, worn down.—*Bunsen* in p. 457-570, *Ed. Ferrier Journ* p. 207, 393.

CUPRESSUS, a genus of plants of the natural order Pinaceæ, of which there are several species C Australis, *Pers*, is a tree of N Holland, C fastigiata, *Wall*, C funebris of China, and the Himalaya, C glauca, *Lam*, the Goa Cedar tree of the gardens of Bombay and the Dekhan, a name also applied to the C Lusitanica, C sempervirens, *Lin*, C horizontalis, the spreading cypress, is a handsome species The common cypress grows in the Himalayas, in Italy, and the S E of Europe, and in Mexico and the southern parts of N America C thuyoides is the white cedar of N America, where its chips are used medicinally as a stomachic, and C tomentosa, *Lamb*, is the twisted cypress of the Himalaya, Butan, and Neetee — *Dis Vogt* 568, *Stewart* 222, *Hogg Veget Kingdom*, *Fortune Tea Districts*, *Riddell Gardening* See Evergreens

CUPRESSUS FUNEBRIS The funeral cypress, *ENG* Grows in the Himalayas, and in China, and is a species of weeping cypress It is a most beautiful tree *Fortune* says, "It was during one of my daily rambles that I saw the first specimen About half a mile distant from where I was, I observed a noble-looking fir tree, about sixty feet in height, having a stem as straight as the Norfolk Island pine, and weeping branches like the willow of St Helena Its branches grew at first at right angles to the main stem, then described a graceful curve upwards, and bent again at their points From these main branches, others long and slender hung down perpendicularly, and gave the whole tree a weeping and graceful form It reminded me of some of those large and gorgeous chandeliers sometimes seen in theatres and public halls in Europe Its stem was perfectly straight, like the Cryptomeria, and its leaves were formed like those of the well known arbor-vitæ, only much more slender and graceful — *Fortune's Tea Districts*, p 61 and 62

## CUPRESSUS GLAUCA

C. Lusitanica?	C Pendula?
Saras	DUK   Goa cedar

This is a tall, elegant, and graceful tree, well adapted for border walks in a garden, being always green, and a favourite with the natives of India It grows easily, and is generally planted alternately with the Areca or be-

tel-nut tree Ships, if taken off before the commencement of the rains, and planted in beds shaded from the sun, take root, each ship should be six inches apart, and if common care is used, one fourth of the plants will strike and grow After that, they may be put out in nursery beds, at the distance of one foot from each other, until required for transplanting to where they are to remain, its leaves have a singularly glaucous colour — *Riddell, Gardening Engl Cyc* p 258 *O'Shaughnessy, Bengal Dispensary*

CUPRESSUS SEMPERVIRENS WILLDE			
Shaj ul Hyat	ARAB	Cypress	ENG
Saras	DUK	Sarv	PERS
Evergreen Cypress	ENG	Saro	HIND

The cypress tree is found in gardens in India and North America, but is a native of the warmer parts of Europe, though it has long been transferred to gardens for the sake of its deep coloured, evergreen branches and leaves Among the ancient inhabitants of the Grecian Archipelago, it was customary, upon the birth of a daughter, to plant a Cupressetum, or grove of cypress trees, to be given to her for a portion hence every plantation of this kind was called *dos filia*, or a daughter's dower According to Evelyn, the timber of the cypress was of infinite esteem among the ancients It has been supposed that the durable bridge built over the Euphrates by Semiramis was made of this material, and it is reported that Plato chose it to write his laws on, before brass itself It is certain that it never rifts or cleaves but with great violence, and the bitterness of its juice preserves it from worms or putrefaction The gates of Constantinople, famous for having stood from the time of Constantine to that of Pope Eugene IV, a period of eleven hundred years, were of cypress, and it is described as hard, elastic, and strong It resists worms, and its odour repels insects from whatever may be contained in a cabinet or chest made of it The tree grows in the outer Himalaya up to 5,000 feet, and attains a girth 6 to 8 feet, and a height of 40 to 45 feet, and it also grows at Kabul, but Dr Stewart says its wood is of no especial value there Its fruits were formerly deemed astringent, and were much used in medicine, but are now obsolete The oriental physicians used to send their patients labouring under lung diseases to breathe the air of Candia, where the cypress was abundant, in the persuasion that the emanations were particularly wholesome The precise period or the age to which the tree lives have not been clearly ascertained In some countries this tree is planted over the graves of the dead as an emblem of immortality There are several species of this class of evergreen trees — *Dr O'Shaugh-*

nessy, p 621 *Dr Irvine*, p 208 *Eng Cyc*

### CUPRESSUS TORULOSA D DON

Devi dr of Ravi | Gall of Sutlej  
Deodir Beas and Sutlej

This tree grows on the Ravi and Beas, on the outer hills near the Sutlej, in Kullu, in Nynee Tal up to 8,000 feet, and Dr Stewart has seen a tree 120 feet high and 15 feet in girth. It grows also in Butm and Niti. The people assert that the wood lasts for centuries, but it seemed to him too soft to be durable, and it is too flexible for posts. In Nynee Tal it is used for roofs. In its eastern localities, the tree is deemed sacred, and is not felled, and in Kullu images are made of its wood — *Fortune's Tea Districts*, p 364 *Dr J L Stewart* p 222 *Voigt*, p 558

CUPRUM LAT Copper, hence cupri-subacetos, LAT Veidigris Cupri Sulphas, Blue Stone Sulphate of Copper, the Cuprum vitriolatum

CUPULIFERÆ See Carpinus

CURAO, also written Karao, seemingly from "karana," to cause to do, the term given among the Jat, Goojur, Ahir, and other races and tribes in western Hindustan, to concubinage generally, but more especially to marriages of widows with the brother of a deceased husband. The practice, which is also known to the eastward by the name of Oorhuree, in the Deccan of But'hee, and, in other provinces, by the name of Dhureecha, is followed among these classes, but is not very openly confessed even among them, as some degree of discredit is supposed to attach to it. It is only younger brothers who form these connections, elder brothers being prohibited from marrying their younger brother's widows, but among the Jat of Delhi even this is not prohibited. The practice has been common among several nations of the East. The Jews followed this custom, and in Egypt it was admitted for a childless widow to cohabit with a brother of the deceased husband. When the laws of Menu were enacted Curao appears to have been a recognized institution. But as is not unusual with the Institutes, there is much contradiction between the enactments relating to it. From a consideration of all the passages on the subject it appears that failure of issue was the point on which the legality turned. He who was begotten according to law on the wife of a man deceased, or impotent, or disordered, after due authority given to her, is called the lawful son of the wife (Ch IX, v 176.) From the fact of Diupadi marrying the five Pandoo brothers, we learn that polyandry

must have prevailed amongst the races of that period, and if polyandry, the practice of Curao was, no doubt, not uncommon indeed, Vyasa, the compiler of the Mahabharata, was himself appointed to raise up offspring to his deceased brother. There is perhaps no circumstance which so strongly shows the northern descent of the deified heroes, as this marriage. Herodotus tells us that the practice prevailed among the nomadic Seythians, as it does at present among the Bhottia. The practice is adopted also by the Nair race of Malabar, between whom and the people of the Himalaya, Wilson traces the obscure vestiges of a connection.

Amongst the Jat, Goojur, and Ahir, children born Curao are considered legitimate, and are entitled to inheritance accordingly. Children begotten by the woman previous to Curao, except in the case of fraternal Curao, are known by the name of Kudhelma, and do not inherit the property of the father-in-law — *Elliot Sup Gloss quoting Recherches Phil sur les Egyptiens et les Chinois Selections from the Mahabharata*, p 8 and 66

elata	petiolata	

East India arrowroot is procured in part from *Curcuma angustifolia*, known locally in India, as Tikoor, and a similar kind of starch is yielded by *C zerumbet*, *C rubescens*, *C leucorrhiza* and *Alpinia galanga*, the Galangul root of commerce. The particles of East India arrowroot are very unequal in size, but on the average are larger than those of West India arrowroot—*Drs Roxb O'Shaughnessy, Voigt, Birdwood, Major Drury*

#### CURCUMA AMADA, ROXB 1 53

Amada	BENG	Ain Kaula	TEL
Mango Ginger	ENG	Kacholam	
Tomuon munga	MALAY		

A plant of Guzerat, Concan, Bengal, and Java root used medicinally. The name of mango-ginger is given to this root from its peculiar smell while fresh. It is a gentle stimulant, but now only used as an article for seasoning food. Ain kanla meaning "six eyes," Shadgrandika "six jointed," are also given as syns of Nalla ativasa or *C. caesia*, and seem to be merely Sanscrit forms of the same word, both probably referring more correctly to *C Zedoria* or "long zedoary"—*Roxb Voigt O'Shaughnessy, p 649.*

#### CURCUMA ANGUSTIFOLIA ROXB

Narrow leaved		Kuay kalung, lua	
turmeric	ENG	koghai	MALEAL
Tikur, Tikor	HIND	Kua-mao, Kua-	
Kughu	MALEAL	kalang, kua	TAM

This plant grows wild in all the hilly parts of the centre of the peninsula, in Central India, in the forests, extending from the banks of the Sone to Nagpore abundantly on the Malabar coast, is cultivated about the districts of Patna, Sagur, Benares and the south-west frontier of Bengal, also in Mysore, Vizagapatam, Sholapore, Mahabaleshwar, Ganjam, Cochin and Tellicherry, and is used

by the natives for food. It has stalked narrow, lanceolate leaves. Its tubers are found at the end of fleshy fibres, which meet together, forming a crown, and they yield an excellent arrowroot called the East Indian arrowroot of commerce. Mr Rohde has brought arrowroot from the Kond race of Smadali, which was obtained from the *Curcuma montana* and *angustifolia*. This starch has been prepared in large quantities on the western coast for many years, in Travancore, Cochin and Canara, where the farina is extracted from the pendulous tubers of these and other species of *Curcuma*, and this excellent substitute for the West Indian article might be produced in large quantities all over the peninsula. It is sold at 3s 4d the lb. The method of preparing the arrowroot is substantially the same from whichever plant it is extracted. The commercial value of the East Indian farina is very much below that of the *Mananta* arrowroot. It is less used as an article of diet, but is largely bought by the starch makers of London. *Kutchoor* is a general name given to the genus *Curcuma*. The tubers should be planted in a good rich soil, about one foot apart, just before the rainy season, and taken up as soon as the leaves are dry. Rats, porcupines, and wild hogs are very destructive to it, both when first planted, and also when ripe. Such tubers as are required for seed should be kept in a dry place in sand—*Roxb 1 31 O'Shaughnessy, p 649 Simmond's Comm'l Products, page 351 Eng Cyc page 261 M E J Reports Australie, p 242 Rohde MSS*

Haradul	GUZ	Praspu	TLL
Koonhet	MALAY	Pampi	"

Turmeric is grown all over India and the archipelago. It has large whitish flowers, with a faint tinge of yellow, the tuft greenish white. In cultivating it the ground must be rich, friable, and so high as not to be drowned in the rainy season, such as the Bengali ryots about Calcutta call Danga. It is often planted on land where sugar-cane grew the preceding year, and is deemed a meliorating crop. The soil must be well ploughed and cleared of weeds, &c. It is then raised in April and May, according as the rains begin to fall, into ridges nine or ten inches high, and eighteen or twenty broad, with intervening trenches, nine or ten inches broad. The cuttings or sets, consisting of small portions of the fresh root, are planted on the tops of the ridges, at about eighteen inches or two feet asunder. One acre requires about from nine hundred such sets, and yields in December and January about two thousand pounds weight of the fresh root. The tubers are a deep orange inside, bitter and aromatic. The coloring matter of the dried root is bright yellow, soluble in alcohol and water, and changed to a deep red by alkalis. White paper dyed by an alcoholic tincture of turmeric is a very sensitive test for alkalis. The root is used by the dyers in dyeing yellow and green, and it enters into many of the religious ceremonies of the Hindus. The entire, or the corners of every new article of dress whether of man or woman, are stained before wearing it with a paste made of the root and water. Mixed with lime it forms the liquid used in the Arati ceremony, for warding off the evil-eye. Women use it largely as a cosmetic, and some smear all the body with it as a detergent. It is a mild aromatic and carminative and is used as a condiment in curries, the paste is applied to foul ulcers, and clothes dyed with it are deemed a protection against fever, and the Javanese make an ointment of the pounded roots and rub it all over their bodies as a preservative against fever. With it, in conjunction with lime juice, the Hindoos of the sect of Vishnoo prepare their yellow Tirochoornum, with which they make the perpendicular mark on their foreheads—*Ain's. Mat Med p 203 Roxb 1 32 O'Shaughnessy p 649. Royle 616 Dr Shortt*

CURCUMA RUBESCENS Roxb 1 p 28

Tikor BENG

A native of Bengal, Chittagong, Burmah and Pegu, the root is highly aromatic, but its chief use is for the preparation of *Tikor*—a very fine fecula, like arrowroot, which, in Travancore, constitutes an important article of food—*O'Shaughnessy, p 649*

A native of Bengal, Chittagong and China. This is the *round zedoary*, all kinds of which resemble ginger in their medicinal qualities, but are inferior to it in strength and agreeableness of flavour. Its flowers are largish, of a deep yellow, and at the top a bright crimson tuft. This plant is supposed to yield the long zedoary of the shops, the powdered root is mixed with the powder of *Cæsalpina sapan* to make the "abi" or "shagoo," the red powder thrown about by Hindoos in the holi festival, the root is also used medicinally *Roxb 1 20 Vingt 564 O'Shaughnessy p 640*

CURCUMBARRY, a valley once filled with forest trees, 90 miles west of Madras, near Nagery in the N Arcot collectorate. But the valley is deforested, though the conservator reported that if strict vigilance were not exercised, the forest would disappear and the ryots will not only suffer from want of fuel, but the climatic effect may be disastrous.

CURDAPU TAM an article of jewellery

CURDEE HIND? Safflower Seed Safflower-oil is a light yellow, clear oil, when properly refined or prepared it is used in India for culinary and other purposes, and deserves attention as no doubt it could become a staple import. It is used as a 'dying oil,' and it is believed to constitute the bulk of the celebrated 'Macassar oil.' The safflower seed is exported under the name of "curdee" Safflower is sown in October, either alone, or along the edge of wheat crops, both light and heavy soils are adapted to it. It is cultivated in every village but not extensively. The oil is extracted by pressing. In Lucknow the cost of the seed, which is there called 'Barie,'

is 18 $\frac{3}{4}$  seers per rupee, and the cost of the oil is from 3 to 4 seers per rupee — *Ex* 1862

**CURDUCHIA** Kuidistan, the ancient Carduchia of Xenophon, a country more fruitful in soldiers than in grain, but which from its strength and position commanded all the western part of Persia. It is inhabited by tribes who though tributary to Turkey and professing mahomedanism, are virtually independent. Many are nomades. Sir John Malcolm travelled through their country in 1810, and from what he had read and seen of its inhabitants, he formed the opinion that they had remained unchanged in their appearance and character for more than twenty centuries.—*Malcolm's History of Persia, Vol I p 105 Chatfield's Hindustan, p 149*

**CUREA**, ALSO **KARIA** HIND A village, from the Arabic, assembling together, a concourse. The word is preserved in Cureat Mittoo, Cureat Seek'hai, Cureat Dost, and Cureat Mendhoo, the names of pignualis in the province of Belares

**CURIA MURIA ISLANDS**, on the Mahra coast of Arabia, were ceded to the British in 1854 by the Imam of Muscat. They are only valuable for deposits of guano

**CURIEUSE**, one of the Seychelles, lies north of Praslin in L 4° 16' S

**CURIOSITIES**, Under this general term are included a great variety of articles purchased by those who visit China as articles peculiar to the country. They consist chiefly of such things as please the fancy, and are for the most part procured for ornamental purposes. Vases, pots, jars, cups, images, statuettes, ornamental screens, plates, boxes, &c made of copper, iron, bronze, clay, silver, porcelain, stone, laceredware, or wood, of every shape, size, and variety of workmanship, rings, stands and pedestals, lanterns, scrolls, &c &c constitute most of the articles exported as curiosities. The amount is probably over \$20,000 annually.—*Hon'ble Mr Morrison's Compendious Description Williams' Middle Kingdom II p 400*

**CURIVADU** See CURIVADU

**CURKAPULIMARAM** TAM Inga dulcis Curkapul Oil Oil of Inga dulcis See Oil

**CURLEW ISLAND**, a name of Kalagouk, a quarry for the Alguada reef lighthouse establishment, it is situated in the Gulf of Martaban, 30 miles south of Amherst. It is eight miles long, exclusive of Cavendish Island, which lies at its extreme south end, and which is half a mile in length. The greatest breadth is one and a quarter mile, and on its highest point, which is about 500 feet above the sea, are "remarkable trees"—a point for navigators making the coast. The base of the island is granitic rock, the sub-

stratum being a rich mixture of open porous soil, composed of sand and vegetable mould. The northern half, on the western side, is composed of a long granite ridge, with a perpendicular drop to the sea, varying from 200 to 300 feet. On the opposite side are three bays, the finest of which is Quarry bay, where the stones were prepared for the Alguada lighthouse. All the bays on the eastern side are perfectly protected from the south-west monsoon, and the one on the western affords a free, open and safe place for boating during the north-east monsoon. Dr Macpherson strongly urged government to take an interest in the development of the island, but when the Editor visited it in 1863, he reported it as wholly unsuitable for a sanitarium

**CURMA**, in hindu mythology, the second incarnation of Vishnu in the shape of a tortoise. See Avatara Vishnu

**CURMBOLE**, MALAYALA, a tree of the Canara forests, which grows to about twelve or eighteen inches in diameter and from fifteen to thirty feet high, it is used by the natives for house-work, and is considered a useful and durable wood.—*Edye M and C*

**CURNUM**, TAM TEL A village accountant.—*Wilson*

**CUSTARD APPLE SEED**, called Sheir-fah, disperses vermin. Flies are reported never to settle on the tree or its fruit, though ants will attack both. Bugs have a great antipathy to the leaves of the custard apple, and are said to quit a bed in which they are placed. The bruised seeds of the custard apple are said to dispel bugs.—*Tennant's Ceylon O'Shaughnessy Hooker Him*

## CURRANTS

Korinthen GERM	thiceæ	LAT
Uve-passe de Cor-	Korinka	RUS
into IT	Opoek	
	Pasas de Corinto	SR

The currants of commerce consist of the small dried grape, or berry, of species of vine, cultivated in the Morea, Ionian islands, and some parts of Persia, &c. A currant, like the European red currant, called "rasta", is largely eaten by the people of the upper Punjab. Currants (zirishk), both acid and sweet, the former being the fruit of the berberry dried, and which resembles European currants, are brought from Kabul and other hill places. The zirishk currants are of two kinds, somewhat alike in appearance, one is sweet, and grows in Kabul, &c, being a species of small fruited vine (*Vitis*), the other is acid, being the dried berberry. Sweet currants "basho" (Thibetan), from species of *vitis*, are imported from Balti.—*Faulner. McCulloch's Commercial Dictionary, p 456.*

**CURRENCY** The currency of British India is in the form of rupees, annas, and pice. The rupee is a silver coin, weighing three drams or a tola of 180 grains, and its rate of exchange varies a little under 2 shillings. It is current all over British India, on the coast line of the southern shores of Persia, Turkish Arabia, Arabia and Egypt, Arracan, Pegu, and Tenasserim, and southwards towards the Mauritius. The dollar is current from Singapore, through the Archipelago of Asia, in Borneo, Celebes, China, Cochin China, Java, Malay Peninsula, Manila, Siam, Sumatra, &c.

The silver currency of the rupee was established by Act xvi of 17th August 1835, and the standard was fixed at eleven-twelfths or 165 grains of pure silver and one-twelfth or 15 grains of alloy. On the obverse the head of the reigning sovereign of Great Britain and Ireland, on the reverse the words East India Company in English and Persian, and it is a legal tender. It was declared equal to the Furrukhabad, Bombay, Madras, and Surat rupee, and 15-16th of the Calcutta sicca rupee. The same act of the legislative council declared that the only gold coins that should be coined in British India should be the gold mohur of 180 grains, 165 pure gold and 15 of alloy, a five rupee piece, equal to a third of a gold mohur, a fifteen rupee piece, or gold mohur, and a thirty rupee piece, or double gold mohur.

*The Imports of Gold and Silver into all British India have been as under, ranging in value from two millions to twenty six millions a year*

Year	Gold in all forms	Silver in all forms	Total imports Gold & Silver in all forms
£	£	£	£
1854-55	882,721	1,145,137	2,027,858
1855-56	2,508,353	8,792,793	11,301,146
1856-57	2,176,002	12,237,695	14,413,697
1857-58	2,830,084	12,985,332	15,815,416
1858-59	4,437,339	8,379,692	12,817,031
1859-60	4,288,037	12,068,926	16,356,963
1860-61	4,242,441	6,434,636	10,677,077
1861-62	5,190,432	9,761,545	14,951,977
1862-63	6,881,566	13,627,401	20,508,967
1863-64	8,925,412	14,037,169	22,962,581
1864-65	9,875,032	11,488,320	21,363,352
1865-66	5,372,894	20,184,407	26,557,301
1866-67	4,581,472	8,655,432	13,236,904
1867-68	4,775,924	6,999,450	11,775,374

The great range in the quantities imported of gold and silver, from two millions in 1854-5 to 26½ millions in 1865-6, indicates that the import is chiefly regulated by the requirements of commerce, but it is generally believed that a considerable amount is being absorbed in India by the manufacture of silver and gold ornaments. From the earliest historic times gold coins have been in use in India. Coins found in Afghanistan contain Greek legends from Seleucus Nicator 280 B. C. to the middle of the 2nd century of our era, Greeks were largely mixed as colonists with the nations over whom they reigned. We have first pure Greek coins, next Arsacid, and then Sassanian, when the Greco-Parthian dominion in central Asia closed. There was during great part of this period an Arsacid-Parthian dynasty, reigning over Kabul and the Punjab, but after A. D. 80, a new order of coins is found bearing the name of Kameikes with legends in corrupt Greek. These are ascribed to a new race of Scythian kings who immediately succeeded those named Kadphises, of which name three kings are recognised by these coins.

A legend on the obverse of a coin of Oomen Kadphises, Arrian character, which reads from right to left, translated, gives words in modern Hebrew.

By Act xvi of 20th December 1835, the copper coins established were a double pice of 200 grains troy, a pice of 100 grains, and a pie or 1-12th of an anna, of 33-½ grains, and the Trusteeship pice of Benares was abolished. Two subsequent acts ordered the heads of king William and then of queen Victoria to be stamped on the obverse.

In the Hyderabad state there are several silver and many copper coins current, and in the town of Oomraoti the merchants pass from each other sealed bags of money as a currency. The Chinese currency is a copper coin, silver is sold by weight. Peguottis speaks of the celebrated paper money of China, once deemed a fable of Marco Polo, though before his time even it had been distinctly mentioned by the intelligent friar Rubruquis. Its use was of great antiquity, for traces at least of leather representatives of money are found as far back as B. C. 119. Though the government of China has not issued paper money since then, there has been considerable local use of such currency among the people, even in our own time. In Fucheu, some years ago, it had almost displaced bulhon, and in that city the banking houses were counted by hundreds. Though the system was under no efficient control, few notes were below par, and failures of any magnitude were rare. The notes were chiefly from copper plates (and such

notes were engraved in China as early as 868) and ranged in value from 110 cash to 1000 dollars. Ku-khatn Khan of Persia was persuaded to attempt the introduction of a paper currency under the Chinese name (chao) in 1294.

In China, the legal standard, silver, measured, has a fixed standard fineness, and gold is but merchandise. England has its standard of gold. France has a double standard of gold and silver, but from Constantinople to Japan, both inclusive, silver and not gold has been and is now the sole standard. Under the Romans the relative value of gold to silver was ten of silver to one of gold. At present about fifteen pounds of silver is equivalent to one pound of gold. In India and China, sovereigns are quoted in the price currents as merchandise, but only in Ceylon and the Mauritius are they a legal tender. It is supposed that the annual production of new gold is about £20,000,000, and that of new silver about £19,600,000. The supply of new silver has not quite equalled that of new gold, being short by about two per cent per annum. From the middle of the 19th century it has several times been suggested to make gold a legal tender in British India, by reckoning the gold sovereign as the equivalent of ten rupees. But in India generally, the bulk of the community virtually make the copper coins the standard, and the values of the silver coins vary daily and hourly in the bazaar, while, except as merchandise, gold coins are never seen, and for a long further period, whatever the governments of India may decree, copper coinage will regulate the values of the silver, gold and paper in use. Mr. Wilson, when finance minister of India, estimated the whole coin current in India at one hundred crores of rupees, £100,000,000 sterling, and he believed that a great part of that amount might be transferred from unproductive to productive uses by the gradual substitution of Government promissory notes payable on demand. There was even then a note circulation current in India, but only of a limited and local character, and on the private responsibility of the three Presidency banks, and this Mr. Wilson proposed to withdraw previous to the issue of his paper currency. But Sir Charles Wood, then Secretary of State, suggested changes to be made in it which Mr. Laing gave effect to, and it was issued with a ten rupee note as the lowest. The Government scheme took effect in March 1862, in which month notes to the value of Rupees 369,00,000 were issued, and in September 1863, notes to the value of Rupees 5,26,00,000 were in circulation — (*Yule Cathay*, ii, p. 290)

CURRIE, SIR FREDERICK, BART. Twice

Governor of Bombay, Chairman of the Board of East India Directors, Vice-President of the India Council. He was born the 31d of February 1799, received his education at the Charterhouse, where he was the school-fellow of Havelock, Thurlwall, and Grote. He entered the civil service on the Bengal establishment in 1817, in 1839 he became Secretary to the Governor General of the N. W. Provinces, Secretary to the Government of India in 1842, and accompanied Lord Dalhousie in his campaign across the Sutlej in 1845, and the following spring. In his despatch to the Secret Committee, dated from the Camp at Ferozepore, December 31, 1845, the Governor General thus expressed himself — "I owe great obligations to the Chief Secretary to the Government, Frederick Currie, Esq., who during all the various, and sometimes conflicting, duties in which I have been engaged, has given me his sound advice, and active aid, sometimes accompanying me in the field, and at all times evincing the coolest judgment and exhibiting the resources of his experience to the great advantage of the Company's service." Sir Frederick's services were again acknowledged in the general orders in the February following, and he was afterwards deputed to conduct the maharajah Dhuleep Singh in state from the palace to the citadel of Lahore, and to arrange the treaty at Umritsar. He was appointed a member of the Supreme Council at Calcutta in November 1846, and held that post until 1848. He sat as an ordinary member of council from March 1849, down to the year 1853. He was created a baronet December 17, 1846, immediately after the battles of the Sutlej. He returned to England towards the close of the year 1853, and in the following month of April, was nominated by Her Majesty's Government one of the Court of East India Directors. He was chosen Chairman of the Company in 1858, and held that appointment until the cessation of the functions of that body, on the 1st of September 1858.

CURRYING OF LEATHER This is an art but little practised among the natives of India. The chuekler by whom every operation is conducted, from the skinning of the beast to the binding of a pair of shoes,

shaves the hide or skin down with his knife, beats and rubs it with his maul, and blackens it with iron liquor, to which plantain root and conjee water are sometimes added sometimes a little lamp oil is used — *Rohde MSS*

CURRY LEAF TREE *Beigera Kougni*  
CURRY MARDAR WOOD. *ANGLO-TEL.*

*Terminalia glabra*

CURRY Ibn Batuta describes the natives of Ceylon as eating curry, which he calls in Arabic *Conchian*, but in modern Arabic *Idaan* is the name. This was 200 years before the Portuguese had appeared in the Indian seas. In the Rajavali, also, this article of diet is mentioned as in use in Ceylon in the second century of this era. Nevertheless, several writers have suggested that the word has been introduced from the Portuguese. Professor Wilson supposes it derived from *Kadi* or *Kari*, *Kain*, boiled sou milk used with rice. The word however is, seemingly, from some Tamulian tongue, probably from the Tamil word "*kadai* or *kara*" a bazaar, and Tamil children in the peninsula sing a nursery song

Ky viss ammah ky viss,

Kadi ki polam ky viss

Swing your hand, mother, swing your hand,  
Let us go to the market, swing your hand.

Curry in Urdu or Hindustani is called *Salin*, in Tamil *Karri*, in Telugu *Koora*, in Persian *Nan-Khooish*. Curry is daily used in every family on the coast, wherever the Bengali, the Tamul, Telugu, and Mahatta people have spread, in greater or less quantity according to the means of the family, always with vegetables and with mutton or fowl as they can afford. With the people the ingredients are usually brought fresh from the market daily, but Europeans in India often grind the dry materials and keep them in powder. There are very numerous prescriptions, and almost every household has one of its own. Up to the middle of this century many houses prided themselves on their curries. The curry powders of India are articles of considerable commercial traffic, 32,550 cwt of curry stuff was imported into Ceylon, chiefly from India, in 1851. The usual ingredients for curry stuff are

Native Name	English	Botanical
Sonf	Anise seed	<i>Pimpinella Anisum</i>
Seetul cheenees gach	Allspice	<i>Myrtus Pimenta</i>
Elachie	Cardamom	<i>Elettaria cardamomum</i>
Leong	Cloves	<i>Eugenia Caryophyllata</i>
Jawatrie	Mace	<i>Myristica Moschata</i>
Jauphull	Nutmeg	Do Do
Kulmi darchini	Cinnamon	<i>Laurus Cinnamomum</i>
Dhunnia or Kotimar	Coriander	<i>Coriandrum Sativum</i>
Zeera	Cumin seed	<i>Cuminum Cyminum</i>
Kali mirchie	Black pepper	<i>Piper Nigrum</i>
Rai	Mustard seed	<i>Sinapis Chinensis</i>
Lal mirchie	Chillies	<i>Capsicum frutescens</i>
Huldi	Turmeric	<i>Curcuma longa</i>

Native Name	English	Botanical
Maytie	Fenugreek	<i>Trigonella Lamum — Greecum</i>
Lassun	Garlic	<i>Allium Sativum</i>
Sont	Ginger, dry,	} <i>Anomum Zingiber</i>
Udruck	Ginger, green	
Khush khush	Poppy seed	<i>Papaver Somniferum</i>
Pipel	Long pepper	<i>Piper longum</i>
Hing	<i>Asafoetida</i>	<i>Terula Asafoetida</i>
Chironji	Chironjee nut	<i>Buchanania latifolia</i>
Badam	Almond	<i>Amygdalis Communis</i>
Narel	Cocoanut	<i>Cocos Nucifera</i>
Nemuck	Salt	

Good ingredients for making a curry with meat, fowl, or fish are

Mirchie	Chillies, dry or green, from 6 to 12 or more
Huldi	Turmeric, one <i>Tolah</i>
Dhunnia	Coriander seed, one "
Zeera	Cumin seed, three <i>Masha</i>
Elachie	Cardamom seed, two "
Maytie	Fenugreek, three "
Sont	Dry ginger, three "
Kali Mirchie	Black pepper, one <i>Tolah</i>
Nemuck	Salt, two "
Leong	Cloves, twelve,
Jawatrie	Mace, one <i>Masha</i>
Kulmie darchinie	Cinnamon, one <i>Tolah</i>
Narel	Cocoanut, eight "
Chironji	Chironjee nuts, six "
Badam	Almonds, five "
Khush khush	Poppy seed, five "
Pear	Onions, a table spoonful, sliced
Lassun	Garlic from one to three cloves
Ani	Mango, dried or green, a few sheets
Imlec	Tamarinds, fresh or salted, a small quantity
Leemboo	Lime juice, one dessert spoonful
Tyre	Curds, three table spoonful
Ghee or Butter	three table spoonful

These are the quantities of the various articles to be used in the preparation of a curry, bearing in mind that it is unnecessary to use the whole of the spices together, or the mangoes, tamarinds, or lime juice. neither the cocoanut with the almonds and the ginger may be omitted when dry ripe chillies are used, as likewise the cumin seeds with the coriander, both of which are better for being roasted. Cocoanut milk is much used on the coast in forming the gravy to many curries, especially fish and prawns, as well as the oil fresh expressed from the nut when grated. If the curry is to be dry, the onions must be fried brown in ghee or butter, and the ingredients ground to a paste with water mixed in the same, the meat, and fowl added, stirring the whole until the gravy and butter are absorbed. For a gravy curry, cut the meat or fowl into slices, put the ghee into a stewpan over the fire with the sliced onions, and dress them, then add the meat with the ground ingredients, and some water or broth, mix well together, and let the whole simmer gently until the meat is properly done. Chundoo is made with meat or fowl that has been previously dressed. It is to be minced up and added to chopped onions fried in ghee, with whole red chillies, and the other curry ingredients well mixed together, the frying is continued until the meat is perfectly brown and the gravy quite absorbed. Dr Riddell gives the following ingredients for four curry powder receipts

	No 1	No 2	No 3	No 4	
Coriander seeds	lbs 20	lbs 12	lb, 3	lbs 1	To be well roasted
Turmeric,	" 1	" 2	" 1	" 1 2oz	Pounded
Cummin seeds	" 1	" "	" 1	" "	Dried and ground
Longreck	" 1	" 1	" "	" 0 4oz	
Mustard seed	" 1	" "	" 1	" "	Dried and cleared of husks
Ginger, dried	" 2	" 2	" "	" 1 "	
Black pepper	" 2	" 1	" 1	" 1 "	
Dried Chillies	" 1	" 2	" 1	" 0 12oz	
Poppy seed	" 2	" 2	" "	" "	
Garlic . . .	" 2	" 1	" "	" "	
Cardamoms	" "	" "	" "	" 0 8oz	
Cinnamon	" "	" "	" "	" 0 8oz	

Salt in proportion to be added when using the curry stuff. The whole to be cleaned, dried, pounded, and sifted, then properly mixed together and put into bottles, well corked. A tablespoonful is sufficient for chicken or fowl curry. Another very simple receipt is powdered turmeric 22 tea spoonfuls, red dried chillies or Cayenne pepper, 8 Ditto, Coriander seed, Cummin seed, dried cassia leaves (tepat), each twelve tea-spoonfuls and mix together — *Riddell's Domestic Economy*, p. 404 *Simmond's Com Prod*

**CURU, or VRIHASPATI** A name of Jupiter See *Griha*

**CURU**, the founder of the race who contended with the Yadu for dominion in Hindustan, at the battle famed as Kuru-khet, which is described in the Sanscrit poem the Mahabharata. Curu had two sons, Sudina and Parikhita. The descendants of Sudina terminated with Jarasandha, whose capital was Rajgraha, the modern Rajmahl, on the Ganges, in the province of Bahar. From Parikhita descended the monarchs Santana and Balica the first producing the rivals in the great war, Yoodishtia and Duryodhana, the other the Balicamntia. Dnyodhana, the successor to the throne of Curu, resided at the ancient capital Hastinapoor, while the junior branch, Yoodishtia, founded Indraprestha, on the Yumuna or Jumna, which name in the eighth century was changed to Delhi. The sons of Balica founded two kingdoms, Palibot'hra on the lower Ganges, and Arore founded by Sehl on the eastern bank of the Indus — *Tod's Rajasthan Vol I, p 42*

**CURUMBAR**. In the southern districts of the peninsula of India, an ancient aboriginal people of this name are the earliest known occupants of Dravida desam, the modern Carnatic and Coimandel. They seem to have established numerous petty principalities over the whole peninsula, which were ultimately absorbed in the Chola empire. Numerous sites attributed to this race and still called Curumber Cot are to be met with. Small communities of the same tribe are found to this day in the less accessible hills and forests of many parts of the peninsula. See India Kurumbar

**CURU VAYRU** or Kussavu *Andropogon* or *Anatherum mucatum* Cuscus root

**CUSA GRASS** *Poa Cynosuroides*

**CUSBHURA**, also written Casbhara, the designation of the artizans who work in bell metal, from Kanso, bell metal, and Bhuma, to fill. They are also employed in fusing precious metals and making ornaments which require to be formed in moulds. They comprise one of the sub-divisions of sonar or goldsmiths, of which, in Hindustan, the others are

Muthoorea Myr	Pooibea,	Agurea,
Khuttra,	Canoujea,	Birpoorea,
Kumethika La	Mahour,	Chhyneewan
hourea,	Muhumnea,	Mungorea

Of these Muthoorea ranks the highest. The Cusbhara is below them all. Amongst these tribes there is a secret language which is adopted for the purpose of concealing their

fraudulent acquisition of property — *Elliot Supp Gloss* See Hindoo, Kansala

CUSCO See Cinchona

CUSCUS Guz and HIND Poppy Seed, properly Khash Khash

CUSCUS-GRASS ANGLO-HIND Andropogon or Anatherum muricatum

CUSCUS ORIENTALIS occurs in Timur See Mammalia.

CUSCUS ROOT		ANGLO HIND	
Bala,	DUK	Viritari,	SANS
Usir,	Guz	Vetti varu,	TAN
Cuscus,	HIND	Curu varu,	TEL
Khis,	Pris		

The roots of the Andropogon muricatus, *Retz*, which grows all over India, and its roots are used for making screens, tatties, punkahs, large fans, or covers for palanquins, and when wetted, a very fragrant smell issues.

CUSCUTACEA, an order of twining, parasitical, leafless herbs, of which twelve species occur in the south and east of Asia,

arabica	cymbosa	macrantha
australis	gundiflora	pedicellata
carinata	hyalena	plumiflora
cinensis	longiflora	reflexa

They twine on various trees, and are found up to nine thousand feet in the Himalaya and Afghanistan. *C. longiflora* is the mlatai of Kaghlan, *C. macrantha*, *Don*, also "called mlatai and amil," grows up to 9000 feet, up to the Indus. Dr J L Stewart tells us that it is found on Populus, Salix, Spirea, Lonicera, Desmodium, Urtica, and Polygonum, and like some of the other species, it exhales at times a very strong scent. It is eaten by cattle and goats. Edgeworth mentions that the mountaineers believe that crows pluck sprigs of this and of *C. angusta*, *Edge* to drop into water, when they become snakes and so furnish food for themselves. Madden states that the natives promise boundless wealth to him who finds the root of it, while others again believe that the possession of its root will confer the gift of invisibility.

*Drs Roxb p 346, 347 J L Stewart Vout p 349*

CUSH and Lava, were the two elder sons of Rama, and from Cush descended the Cushwaha princes of Nuwar and Amber. The race of Cush has no connection with the Causika of Kanouj and the Causambi — *Tod*

CUSH, a descendant of Hasti of the Lunar race, had four sons, two of whom, Cush-nabha, whose descendants are styled the Kausika or Kusika, founded Muhadya on the Ganges, afterwards changed to Canyacubja, or Canouj, which maintained its celebrity until the mahomedan invasion of Shahab-ud-din (A D 1193), when this overgrown city was laid prostrate for ever. It was not unfrequently called Gadhipooria, or the 'city of Gadhi'

This practice of multiplying names of cities in the East is very destructive to history. Abul Fazl has taken from hindu authorities an account of Canouj, and could we admit the authority of a poet on such subjects, Chund, the bard of Puthwiraja, would afford materials. *Perishta* states it in the early ages to have been twenty five coss (thirty-five miles) in circumference, and that there were thirty thousand shops for the sale of the areca or betelnut only, and this in the sixth century, at which period the Rahtore dynasty, which terminated with Jyechund, in the twelfth, had been in possession from the end of the fifth century. Cushamba founded a city which he called after his own name *Causambi*. The name was in existence in the eleventh century, and ruins might yet exist, if search were made on the shores of the Ganges, from Canouj southward. The other sons of Cush built two capitals, Dharmamaya and Vasumuttee, but of neither have we any correct knowledge. *Tod Rajasthan*

CUSHARATHIA MARA. CAN Embryopteris glutinifera *Roxb*

CUSHITE, a race of Arabs who first gave their name to a part of Arabia, they afterwards crossed the Red Sea, and settled in Ethiopia. In ancient times, the Cushite and Joktante occupied Arabia felix when the Ammonite and Ishmaelite dwelt in A deserta, and the Moabite, Edomite, Nabathæan, Midianite and Amalekite in A petrea. See Chaldea, Hindu, Kish Viswamitra.

CUSSAMBIUM PUBESCENS. HAM syn of Schleicheria trijuga, *Willd*

CUSTARD APPLE ENG Fruit of Anona squamosa. The sherish or custard apple seed, disperses vermin. Flies are reported never to settle on the tree or its fruit, though ants will attack both. Bugs have a great antipathy to the leaves of the custard apple, and instantly quit a bed in which they are placed.

CUTAKA—? Stychnos *Sp*

CUTCH, a portion of British India in the N W of the peninsula of India. All between the Aravalli mountains and the Indus, from the Sutlej or Hysudrus on the north to near the sea on the south, is a waste of sand, in which are oases of different size and fertility, the greatest of which is around Jessalmir. Cutch intervenes as a narrow strip of land between the desert and the sea, and makes a sort

of bridge from Guzerat to Sind The northern division of the Bombay army, with its head quarters at Ahmedabad, holds Guzerat and Cutch, and stretches its posts around the Runn or salt marsh, and over the Thnr desert, north of the Runn, as far as latitude  $24^{\circ}$  north The low land of Guzerat resembles that of the Concan, Canara, the Carnatic, and Orissa, but the interior of that province is mountainous The Runn of Cutch during the monsoon is a shallow brackish lake from forty to sixty miles broad, but it dries up during the hot season, and is then covered with grass The climate of the outposts is dry, and in the hot season stimulates to irritability The thermometer rises to  $100^{\circ}$  in the shade The other part of Cutch is an irregularly hilly tract completely isolated by the Runn and the sea On the southern coast the country is a dead flat covered with rich soil, but the northern part has three distinct ranges of hills running from east to west The central of these ranges consists of sandstone, beds of coal, limestone, and slate clay, the hills north of it consist of marine remains, and those on the south and all the face of the country near them, are covered with volcanic matter Cutch is 165 miles long, and from 15 to 52 miles broad and not including the Runn, has an area of 6,100 square miles A remarkable feature of this region is the Runn of Cutch South of the Indus, the land becomes sandy, gradually sloping to the sea, first as a plain covered with a series of billows of sand, then as the level Runn of Cutch up to the mountains of Cutch, the extent being from 500 to 600 miles in length, and varying from 70 to 150 miles in breadth, on which a considerable population dwells The Runn itself is 150 miles from east to west, and about 40 miles broad, but there is a prolongation of the Runn towards Ahmedabad, and a very narrow line to the Gulf of Cambay It is almost level, and a little water from the banking up of the sea by the Simmuni, converts it into a very shallow lake of a foot or two deep, but in the dry season its saline sand and clay soil are hard like a slate billiard table, and the images are so incessant as to deceive ordinary travellers None but experienced guides can travel there

The Put district is immediately north of the Runn, is less saline, and is cultivated The district north of the Runn, extending from 500 miles up to the rivers Indus and Sutlej, is called the Tur, on which are billows or hills of sand 400 to 500 feet high above the sea level, and 200 to 300 feet above the plain Sir B Frere alludes to these as of volcanic origin The inhabitants consist of brahmin tribes, Bhil, Kol, Bhat, Marahta and Sodah

rayputs, who do not practise infanticide The language of Cutch has in it elements of the Guzerati That of the hunters and tanners, Dedh, is another dialect, but the language of Lar is purest—*Sir B Frere* See Abra, India, Jharejah, Kashbin, Kattywar, Khosa, Kaljah, Volcano

## CUTCH

Kat'h	BENG	Kat'ha	HIND
Surh	BURM	Kachlu	MALAY

Cutch, Catechu gambier, and terra japonica are commercial terms for the inspissated aqueous extracts from the bark, wood, and probably the leaves of the *Acacia catechu* and from the leaves of the *Uncaria gambir* A few years ago the terms catechu, terra japonica, and cutch were employed synonymously, but they are now, for the most part, used in trade somewhat distinctively, though not uniformly in the same sense Catechu is largely imported into Bombay from Singapore and China, two varieties, viz black and white catechu, are distinguished from the latter place In commerce the two sorts are known as catechu, or gambier and cutch Most of the catechu from Bombay is said to be from the *Acacia catechu*, and that from Bengal from the *Uncaria gambir* Bombay catechu or cutch is the richer in tannin, it is of a dark brownish red colour, internally as well as externally, and of specific gravity 1.38 Bengal catechu or terra is of a light brown colour internally its specific gravity is 1.28 Both are astringent and bitter, leaving a sweetish taste on the palate Catechu of the *Acacia* is prepared by felling the tree, cutting it up into small pieces, and boiling with water in a narrow mouthed vessel, until only one half of the original bulk of liquid remains The solution is then transferred to a wide earthen vessel, in which the evaporation is continued, the inspissation is completed by exposure to the sun with occasional stirring Before the extract is quite dry, it is placed in cloths, strewed over with the ashes of cow dung, is then cut into small lumps, and again exposed to the sun Mr Parnell remarks that the appearance of the dark-coloured variety or cutch, answers better to the description of this mode of preparation than that of the light coloured variety Thus, which is more pulverulent than the former, is said to be prepared by mixing the concentrated decoction of the tree with a pulverulent substance resembling starch The powder is disposed in a thin layer on a floor or shelf, and the concentrated infusion or decoction allowed to run over the floor, and be imbibed by the powder When the mass is become stiff by drying, it is cut up into small lumps and dried in the sun Both kinds of catechu

contain about half their weight of tannin, which differs from that of galls in affording olive green precipitates with salts of iron, and yielding no pyrogallie acid on destructive distillation. The tannin of catechu is soluble in cold water, catechu also affords a peenhai principle, which has been named *catechin* and *catechuric acid*, which is not soluble in cold water, but is slightly so in the solution of the tannin of catechu. Catechin is extensively used in Indian tanning, and of late years has also been much used in Britain. It tans the skins with great rapidity, but the leather is light, spongy, permeable to water, and of a dark reddish fawn colour. The light coloured variety of catechin produces a softer leather than that tanned with cutch. Catechu produces but little of the deposit of bloom which is yielded by oak-bark, valonia, and divi. A pound of catechu is said to be sufficient for the production of about a pound of leather. Catechu is used by calico printers, to produce a fast bronze on cotton fabrics. When of good quality, catechin is more powerful as an astringent than kino. Of all known astringent substances the catechu appears to contain the largest proportion of tannin, and Mr Purkis found that one pound was equivalent to seven or eight of oak bark for tanning leather. The manufacture of catechin from the *Acacia catechu*, as practised in Canara and Behar, was described by Mr Keri (*Med. Obs. and Inquiries*, vol v), and Dr Hamilton (*Journey through Mysore, &c*, vol iii), and Professor Royle explained, as follows, the process in Northern India. There the knut manufacturers move to different parts of the country in different seasons, erect temporary huts in the jungles, and selecting trees fit for their purpose, cut the inner wood into small chips. These they put into small earthen pots, which are arranged in a double row, along a fireplace built of mud, water is then poured in until the whole are covered, after a considerable portion has boiled away, the clear liquor is strained into one of the neighbouring pots and a fresh supply of the material is put into the first, and the operation repeated until the extract in the general receiver is of sufficient consistence to be poured into clay moulds, which, in the Khere Pass and Doon, where he has seen the process, are generally of a quadrangular form. This catechu is usually of a pale red color, and is considered there to be of the best quality, conveyed down the Ganges, it meets that from Nepaul, so that both may be exported from Calcutta.

The *Acacia catechu* is indigenous, also, in Burmah, rising sometimes to a height of forty feet. Its timber is tough and durable, much used for ploughs. In Burmah, to

make the catechu, entch, or teira japonica, chewed generally with the betel nut, the wood is hewed into chips, boiled, and the liquor inspissated till it become thick enough to spread on a mat, when the drying is completed in the sun. It dissolves completely in water, is slightly bitter, highly astringent, and contains fifty-five parts in a hundred of tannin. Burmahans make two kinds, the red and the black—both from the same tree. The red is preferred in Bengal, and the black in China. It is chiefly made in the neighbourhood of Prome, though the tree is found in all parts of the country. Catechin or cutch is undoubtedly one of the most important exports of Burmah, and Pegu cutch has obtained a reputation, which will always give it a preference in the market. *Acacia catechu*, the tree from which it is procured, begins to appear about six miles to the north of Rangoon, and from thence it increases both in the number and size of the trees, until it constitutes the prevailing character of the forests to the north east of Prome, where the trees are fifty to sixty feet high with a girth of seven or eight feet, and it is said to attain even a larger size in the Burmese territories lying north of the boundary. It is found plentifully in the northern part of the Tharawaddy district, but it is scarcely to be seen on the Tonghoo side of the hills. Thus it is entirely confined to the valley of the Irawady. The manufacture of cutch is scarcely known or practised below Meenday, and that which finds its way into the market as Pegu Cutch probably comes chiefly from beyond the frontier. There is no reason why it should not be manufactured largely from the parallel of Henzada upwards, as the tree from thence becomes inexhaustible, growing over rich rice plains in places of easy access. The catechu obtained from this tree in Pegu, fetches £1 to £5 more per ton than gambier and other astringent extracts.

At the Madras Exhibition of 1855, catechu was seen in the form of—1 Circular flat cakes from Travancore, covered on both sides with paddy husks. 2 Large flat cakes from the Northern Division, varying in colour from brick dust to dull yellow. 3 Round balls of a dark brown colour, the size of a small orange from Mangalore, where a large manufacture takes place. These sorts appeared identical or nearly so, varying only in shape.

Three chief varieties of catechu are described by Fec, and other eminent writers on Pharmacy, viz, that of Bengal, Bombay, and the catechin in masses. Bengal catechu is in pieces of 3 to 4 ounces each, partially rounded, of dull red colour, covered with seeds on one side, fracture dull, undulated, and often marbled, taste astringent and subsequently

sweet, powder grey, tannic acid 48.5 per 100. Bombay catechu is in pieces of 2 to 3 ounces, flattened and round, of brown colour, with seeds externally and internally, fracture shining, and rufely mangled, taste bitter, without any succeeding sweetness, powder brown grey, tannic acid 54.5 per 100. Missive catechu is found in the bizaars in pieces of 3 or 4 ounces, fragments of larger masses, reddish or blackish brown, uniform, shining, wrapped in large nerved leaves, fracture uniform, flavon very astringent, somewhat bitter, with an after sweetness, powder orange. Proportion of tannic acid very variable. The best catechu is of uniform liver brown colour, often adulterated with red clay, this is detected by incineration. Pure catechu leaves no more than 5 per 100 of earthy matter. According to Dr Royle, catechu is seen either in square or roundish pieces or bills, varying in colour, from a pale whitish or light reddish-brown to a dark brown colour, either earthy in texture, or lamellated, or presenting a smooth shining fracture. Some kinds are hence more friable than others, all are without smell, the taste is bitter, astringent, followed by a little sweetness. The pieces are generally of a darker colour externally than they are in the inside. Some of the kinds are covered with rice husks, others are enveloped in the leaves of *Nuclea Brunonis*, a native of the Malay peninsula. The pale variety is usually distinguished from the dark coloured, and said to be imported from Calcutta, but Dr Royle obtained both kinds in the bizaars there, the pale being imported from the upper Provinces, and the dark from Pegu and Singapore. The dark brown catechus are obtained from Bombay, but both kinds may no doubt be prepared from the same tree, as a greater degree of, or longer continued heat, and greater exposure to light, is said to produce the dark colour. The dark are heavier, more dense in texture, and have a resinous fracture. The largest portion of good catechu is taken up by water, especially when boiling, the infusion being of a light or reddish brown colour, according to its strength it reddens litmus, and is strongly astringent in taste. From forming a crude precipitate with a solution of gelatine, catechu is applicable to the tanning of leather, for which it is now much employed. Sir H. Davy, in analysing the Dark and Pale Catechu, or the Bombay and Bengal, as they were called, obtained from

	of Tannin Extractive Mucilage insol residuum			
Dark Catechu	109	68	13	10 = 200
Pale do	97	73	16	14 = 200

The tannin of catechu is very similar in properties to that obtained from galls. The pinci-

ple called Extractive by Sir H. Davy, has by others been called Resinoid matter, Resinous Tannin, and of late Catechine and Catechuic acid. This is most easily obtained by treating gambier with cold water. When of good quality, catechu is a more powerful astringent than kino. Catechu is much used in medicine as an astringent and tonic, being usually given in combination with moracic and earthy substances, the dose is 10 grains, repeated according to circumstances. Dr Timmins employed catechu in lieu of galls in the treatment of 175 cases of fever, and with equally satisfactory results. Two cases only required quinine. The dose was the same as that of gill powder, given with infusion of chiretta. The article produced in Malaya, from the *Uncaria gambier*, has lately been exported from Singapore to England in large quantities for tanning—*Simmonds' Commercial Products*, p 496. *Malcolm's Travels in South Eastern Asia*, 187. *McClelland's Reports Mad Exh Jun Report O'Shaughnessy's Dispensatory*, p 302. *Royle Mat Med* p 351. *Faulkner*.

CUTLERY. The rude and simple implements and tools, which ordinarily supply the wants of the natives of India, the little requirement for cutting instruments as articles for domestic use, and the cheap and abundant imports of the several articles of cutlery, all tend to depress the local manufacture,

yet Salem and Trichinopoly afford abundant evidence of the skill with which this description of manufacture can be carried on. At the Madras Exhibition of 1855, the knives exhibited (or more strictly daggers) from the Northern Division were very good both as to the great excellence displayed in the workmanship, and as to the beauty and delicacy of the damasked surface of the blade. They exhibited in a high degree the proficiency of the operatives in that part of the Madras Presidency.

The Salem cutlery may compete with that of Europe, though the prices are considered comparatively high, and the neatly executed and finished spear heads are superior.

The articles sent to the Exhibition from Austin, a cutler of Trichinopoly, although exhibiting considerable skill in manufacture, were inferior in workmanship to those from Salem. They are however much more moderately priced. The silver ornamental handled knives especially, are considered cheap and very good specimens of an art peculiarly Indian.—*M E J R*

#### CUTT CAN. Catechu ENG

CUTTACK, a town and district in the province of Orissa, Cuttack being Orissa proper, is about 200 miles long, but the Oorah people occupy about 250 miles. The following is the area—Pooree 2,697 square miles, Cuttack 3062, Balasore 1890. The area of the Cuttack tributary mehals is about 15,000 square miles. The Mahanuddy river aided by some of the large streams from the north has formed a rich delta. From the town of Pooree containing the great temple of Juggeenath, conspicuous from the sea to the Dhimah river south of the Balasore district, there is a deltaic tract fully 50 miles broad, and which comprises nearly the whole of the Cuttack district, great part of that of Pooree, and a portion of that of Balasore. In addition to the low districts, Orissa has an enormous tract of hilly country of the interior, the population of which is partly Oorah and partly aboriginal, this latter portion is administered under the Commissioner of Cuttack as superintendent. There are eighteen estates known as the Cuttack Tributary Mehals, viz

Mohurbhuj	Talchir	Nyaguh
Keonjhar	Hindole	Runpore
Nilghur	Nursingpore	Autgurb
Dekanal	Tigerea	Banki
Angool	Baumba	Boad
Duspulla	Kundiapparra	Autmullick

Angool and Banki were annexed for the misconduct of the rajahs. The other sixteen tributary rajahs administer civil and criminal justice, controlled by the Superintendent.

The most powerful of the chiefs are the rajahs of Mohurbhuj and Keonjhar, both of whom rendered good service during the mutinies. Cuttack has been subjected to great vicissitudes from inundations and famines. Frightful inundations occurred in 1823 and 1831, on one occasion causing a destruction of lives estimated at 10,000, and the entire population of 300 villages is said to have been destroyed. In 1867-68, a severe famine occurred. The report of the three Commissioners embraced Cuttack, Pooree, and Balasore, viz, the three districts of Orissa, omitting the hill tracts—in which the famine raged with greatest intensity, and continued longest—Manbhoom, Singbhoom, Midnapore, Bancaora, Raneegunge, Burdwan, Hooghly, Howrah, Naddea, the extent of the mortality never can be ascertained with any accuracy, but Mr. Ravenshaw estimated it at not less than one-fourth of the population. The people of Orissa are of a character and have a language peculiar to themselves.—*Ann. Ind. Adm. Vol. XI p. 263, 261 Nicholson's Treatise, &c p. 181. 1. Stirling in As. Res. vols. XI, XII and Cal. Rev. 1848, vol. IX 190 & A. Prinsep on Saugor island 1832 Bl. As. Trans. 1832 vol. I 25. Dr. Burst's Catalogue. See Inscriptions, p. 371 Karh, Kol, Orissa, Sunderbun.*

CUTTEKKARE, or Giant's Tank in Ceylon, is now out of repair.—*Sin's Ceylon*

CUTTEAMUNDUO, is the juice of the plant Akoo Chenroodoo, or Euphorbia cutteamundoo, and is used in cementing iron, with other substances, the blade and handle of a knife for instance. It is common in the Northern Circars. It is also called Biamah (Chemoondoo). At the Madras Exhibition of 1855, Mr. Elliot exhibited seven articles (basin, cwer, tumbler, &c) made of cutteamundoo gum, moulded with the hand, without any preparation. The fresh juice is used as a vesicant, and also as a cement for fastening knife handles, &c. For the introduction of this interesting substance, a medal was awarded to Mr. Elliot at the London Exhibition of 1851, and for the further application of it to useful purposes, the Madras Jury awarded Honorable mention. Several consignments have been made by Messrs Healy and Luticll, of Vizagapatam, and 2 cwts were sent by request to Professor Solly, Society of Arts, London. The samples exhibited illustrate the variety of uses to which this gum elastic may be applied.—*M. Ex Jur. Rep.* See Gutta

This trailing shrub grows in Ceylon, Malabar, Konkan and Coromandel, by native practitioners the bitter root is mixed with butter, milk and cummin seeds, and given in dysentery, hemorrhoids, and flatulency, and the juice of its leaves is applied to inflamed eyes.—*Useful Plants Voigt p 33*

#### CYCLONE ENG

Hurricane, Eng	Travado, Port
White Squall, "	Tornado, Span

Cyclone is the term applied to the furious tempests formerly called taifun, typhoon, or hurricane, because of their being uniformly found to be whirlwinds. They revolve round a centre, while the centre itself advances, and thus sweeps with destructive violence over vast areas of sea and land. Cyclones occur in the Bay of Bengal, in the Indian Ocean, both to the north and south of the equator, and in the China Seas, but according to Professor Birkmore (p 82), they have never been experienced in all the wide area between Java and the line of islands east to Timor on the south, and the tenth degree of north latitude.

The China Seas are notorious for their furious gales of wind which are known among seamen there as typhoons and white squalls. The Chinese seas are within the region of the monsoons of the Indian Ocean, but the monsoons of the China Sea are not five month monsoons they do not prevail from the west of south more than two or three months. Between  $15^\circ$  and  $20^\circ$  north,  $110^\circ$  and  $115^\circ$  east, there appears to be a system of three monsoons, that is, one from the north-east in October, November, December and January, one from east in March and April, changing in May, and another from southward in June, July and August, chang-

ing in September. The great disturber of the atmospheric equilibrium in the southern Asiatic regions appears to be situated among the plains and steppes of Asia, then influence reaches up to the clouds, and extends to the China Seas, and there it is about the changing of the monsoons that the awful gales called typhoons and white squalls are most dreadful. In like manner, the Mauritius hurricanes, or the cyclones of the Indian Ocean, occur during the unsettled state of the atmospheric equilibrium, which takes place at that debatable period during the contest between the trade-wind force and the monsoon force, and which debatable period occurs at the changing of the monsoon, and before either force has completely gained or lost the ascendancy. At this period of the year, the winds breaking loose from their controlling forces, seem to rage with a fury that would break up the very fountains of the deep.

A typhoon which occurred in China in September 1855, was preceded by a rising of water in wells and ponds many miles inland. When the cyclone reached the coast it submerged about a hundred square miles, occasioning a vast destruction of life and property. The waters of the sea were retained in the country by strong easterly winds for several days leaving a strip of land bordering on the sea quite dry.

*Indian Ocean* Gales and hurricanes occur in the Indian Ocean south of the equator. Trade wind gales occur at all seasons, but chiefly in June, July and August. In these, the wind veers but little, in the extra tropical gales between  $30^\circ$  and  $45^\circ$  the wind veers much, and in the tropical hurricanes the wind veers and shifts. The S W monsoon prevails north of the equator, and when it prevails the south east trade wind acquires additional strength from the demand made upon it to supply the south west monsoon—these two winds being apparently one system under the influence of the earth's rotation and the high temperature which prevails in the northern hemisphere. The hurricanes of the Indian Ocean are usually rotatory. This was shown by Redfield, Thom, Reid and Piddington. South of the equator, they occur in the months of November to May, and travel to the W S W, and afterwards, but not always, to the southward and S E, the wind invariably moving round a central space (which is usually characterised by a calm) from left to right, or with the hands of a watch, while the storm, which has a diameter of 1 to 1500 miles, moves onwards at the rate of 1 to 20 miles, but more frequently 4 to 7 miles an hour, for a period varying from a few hours to ten days, attended with torrents of rain and its northern half often with

lightning Dr. Thom showed that, south of the equator, these rotatory storms are always generated between the N W monsoon and S E Trade wind They occur only during the S W monsoon months, and their rise and progress are intimately connected with the S East trade wind and N W monsoon—two opposing winds With ships, the safest course is to lie to and watch the barometer and wind, till the bearing of the centre be known with some certainty

*India* Amongst the calamities that have overtaken the Sunderbans, have been great inundations caused by cyclones About the year 1581, the tract lying between the Horighatta and the Ganges known as the Backergunge or Burrisal district, was swept by an inundation, succeeded immediately afterwards by an incursion of Portuguese and Mugh pirates In June 1622 this same tract was again inundated, 10,000 inhabitants perishing, and many houses and much property destroyed In A D 1737 happened the great Calcutta storm In A D 1736 the river Megna rose six feet above its usual level at Lakhimpur The cyclone of 1831, over Calcutta, swept away 300 villages and 11,000 people In A D 1833 Bangor Island was submerged 10 feet, the whole of the population, between 2,000 and 4,000 souls, together with some of the European superintendents perished, at Kedgerie, a building 18 feet high was completely submerged the "Duke of York" East Indiaman was thrown high and dry in the rice fields near Futlah in the Hoogly, and in A D 1848 the Island of Sundeeep was submerged A cyclone is mentioned as occurring in Calcutta in 1859, attended with a great loss of life A cyclone of the night of the 5th October 1864 came from the sea, passed over Calcutta, and foundered and stranded steamers and ships of 2000 tons burthen, and swept away every tree and building in a tract 300 miles long This one, originating near the Andamans, travelled in a north-west direction, and struck the coast of Bengal at the Balasore roads and Hidgelee Thence it passed over Calcutta on the 5th October, over Krishnighur and the Bogra district, and finally expended its strength in the Garrow hills The wind destroyed much, but it brought with it a storm-wave 30 feet high, which flooded the country for a distance of eight miles on both sides of the Hoogly river

In Calcutta, and in Howrah on the right bank of the Hoogly the partial or complete destruction of 196,481 houses and huts told a sadder tale than even the violent death of human beings But widespread ruin swept over the fertile tracts of Midnapore, and over

the Sunderbans, which had been recovered from total inundation by the efforts of a quarter of a century, and the expenditure of millions of rupees In many districts, there, no less than three fourths of the whole population, their cattle and other property, were engulfed in sudden destruction Had the Hooghly been the Thames, and London—not so densely populated—Calcutta, a cry could have gone up which could have thrown the earthquake of Lisbon and similar catastrophes, famous in history into the shade In all, about 100 ships were lost and 60,000 persons perished

On the 1st November 1864, the coast of Masulpatam was visited with a cyclone, which formed a storm wave that was driven onward by the cyclone between 12 and 13 feet beyond the ordinary high water mark, and rushing inward for an average distance of nine, and in one case seventeen miles from the shore submerged for the time an area of 780 square miles, and upwards of 30,000 people were drowned The wave rose six feet above the surface of Masulpatam, and washed away three-fourths of that ancient city

On the 1st November 1867, a cyclone rolled up the Hooghly, and devastated many of the eastern districts, with a violence equal to that of the cyclone of 1864 By the labours of Mr Redfield, Dr Reid, and Mr Piddington who have studied the origin and nature of hurricanes, typhoons, or revolving storms, the following important results have been obtained Their existence in moderate latitudes on both sides of the equator, their absence in the immediate neighbourhood of the equatorial regions In the northern latitudes these storms revolve in a direction contrary to the hands of a watch the face of which is placed upwards, in the southern latitudes they rotate in the opposite direction—additions to the long chain of evidence by which the rotation of the earth as a physical fact is demonstrated—*Dr Burs's Catalogue Curiosities of Science*, p 164 *Cal Review*, 1868 (*Colonel*) *Capper's Notice of Trade Winds and Monsoons*, 1 vol 4to 1800 *Piddington on the Law of Storms North China Herald* 22nd January 1856 *Prof Birkmore's Travels*, p 382 *Maury's Physical Geography of the Sea* p 287, 424 *Mr Meldrum in Proc Brit Assoc* 1867 *Calcutta Review* See Monsoons Pulo Aor or Wawoor Pulo Repon or Saddle Island Pulo Pisang or Pambeelan Typhoon. Gales Hurricanes Winds

CYCLOPES OF GREECE, are supposed by Pococke to be the Guelapes from the Jumna or Guckla-des This derivation would

designate them as a pastoral race, from Go, Sansc a cow, but their great irrigation works denote them an agricultural population. A race at some remote time have occupied Beluchistan, who raised great irrigation structures similar to those in Greece, and in the peninsula of India are many vast irrigation structures. The tank at Cumbum, the Hoossam-Saugur tank at Secunderabad, the lake or tank near Bangalore, are each about seven miles in circumference. The Mir Alam lake at Hyderabad, formed during a famine to provide food, cost £130,000, has a steamer on it and a great lake formed in a famine by the damming up of the Gomti river, cost £1 500,000. See Kelat, p 490. Lakes

CYCLOPHORUS, Cyclostomus, Cyclo-topsis, Cyelotus, are genera of molluscs.

CYCLOSTEMON ZEYLANICUM BAILLON, Spurradia Zeylanica, *Thw*, grows in the central province of Ceylon, at an elevation of 3,000 feet.

CYDONIA, a genus of plants belonging to the natural order Pomaceæ, of which four species are known, *C. Japomea*, *C. Smensis*, *C. tomentosa* and *C. vulgaris*, *C. Japomea*, *Pers*, the Japan quince tree, has large crimson flowers, *C. Smensis*, *Thoun*, is the Chinese quince, *C. tomentosa*, *Roxb*, the woolly quince, is cultivated in some gardens of Ajmir, where it is known as the "Valati Bihi," or foreign quince, it is the same as *C. vulgaris*—*Gen Med Top* p 195 *Voigt*.

#### CYDONIA VULGARIS *Pers*

<i>Pyrus cydonia</i>	<i>Linn</i>	<i>Pyrus tomentosa</i>	<i>Roxb</i>
<i>Hibusu firjul</i>	<i>AR</i>	<i>Bihi</i>	<i>HIND PERS</i>
Common quince tree	<i>ENG</i>	<i>Sifaryal</i>	<i>MALAY</i>
<i>cydonia</i>	<i>GHELK</i>		

This small, crooked, and much branched tree, grows in the south of Europe, in Persia, in great abundance at Nuggur, in the N W Himalaya and in Hindustan, and is cultivated from Kabul to Kashmir. Flowers few, of a white or rose colour. The fruit is of a yellow colour, downy and remarkable for its fine odour. The seeds, called Bihi-dana, are in great use medicinally, being brought into India from Persia, Kabul, Kandahar and Kashmir, and are highly valued as a demulcent tonic. It contains some astringent matter. It is now made into a preserve or used for flavouring the preserves of other fruits. There is a "tursh" or bitter, and a "shrin" or sweet quince—*Dr Royle O'Shaughnessy*, p 330 *Roxb* in *Voigt* p 191 *Dr J L Stewart Panj Plants Cleghorn Punjab Report Kullu and Kangra* p 81.

CYGNUS, a genus of birds, of the sub-family Anserinæ, Family Pelicanidæ, Tribe Toti-palmatæ, and order Natatores or swimmers, in their classified position,

Sub-family Anserinæ

*Div 1* Swans, *Cygnus musicus*, *C. atrata*, and *C. olor*

*Div 11* Geese, *Anser* 3 sp. *Bernicla* 1 sp.

*Div 111* *Peiching Geese*, *Deudicocygnus* 2 sp. *Sarcidionis* 2 sp. *Nettion* 1 sp.

*Div 111* *Sheldrakes*, *Casarca tubila*, *Tadorna vulpansei*

*Cygnus musicus*, is the *Cygnus ferus*, or Hooper Swan, and is found in N Europe, Asia, and N Africa. It is migratory, and one specimen was obtained in the valley of Nepal.

Of *Anser*, the goose, the fens of India, the species *A. cygnoides*, *A. cinereus*, and *A. brachyrhynchus* are known in India and the Punjab. Dr Hooker mentions that *A. Indica* occurs at Sihgri.

*Anser cygnoides* is domesticated in China.

*Anser cinereus* (*Anser ferus* 'Grey-lag goose') Europe and Asia common in India. The domestic goose of India is a hybrid between *A. cygnoides* and *A. cinereus*.

*Anser brachyrhynchus* ('Pink-footed goose') Europe, N Asia, Punjab (rare) ?

*Bernicla ruficollis* (*Anser ruficollis*, 'Red-breasted goose') N Asia, chiefly, rare in N India—*Darwin Bunsen Burton's Sind* Vol II, p 137 *Hooker, Him Journ*, Vol I p 399 *Catal Cal Museum*. See *Cygninæ*, *Pelicanus platifrons*, *Birds*, *Goose*, *Hans*, *Hens*, *Henza*, *Natatores*.

CYLLENE, *Cylindria*, *Cylindrella*, are genera of molluscs. See *Mollusca*.

CYMBIDIUM, a genus of orchidaceous plants belonging to the orchidaceæ, all of them with beautiful flowers.

*C. alatum*, *Roxb* of Sunderbuns and Chittagong, has pale sulphur flowers.

*C. aloifolium*, *Swz*, the Paras HIND

*Epidendrum aloifolium* *L*, *Aerides borassii*, *Sim*. Flowers large, dull, purple, white edged, on most of the hills of India. This is a beautiful plant when in flower, and blossoms in April.

*C. aphyllum* *Swz*, the *Limodorum aphyllum*, *Roxb* with yellow flowers, grows on the Coromandel coast.

*C. giganteum* *Wall*, the *Limodorum longifolium*, *Buch* grows on the Khassya and Nepal hills.

*C. pendulum*, *Swz*, the *C. crassifolium* *Wall*, and the *Epidendrum pendulum* *Roxb*, grows in the Khassya hills and in the peninsula of India.

*C. triste*, *Willd*, grows from Nepal and Ceylon to Japan and N Caledonia, has small pale green flowers. It is the *Epidendrum teres* of *Thunb*. *E. triste*, *Forst*, and *Linsin teretifolia*, *Gaudichaud*.

*C. lanceifolium*, *Hooker*, grows in Nepal, and *C. Gibsonii*, *Wall*, *C. inconspicuum* *Wall*, *C. Masterii* *Wall*, and *C. strictum*, *Wall*, grow on the Khassya Hills. Wight also gives *C. erectum*, *C. tenuifolium* and *C. tesselloides*.

CYMBIRHYNCHUS MACRORHYNCHUS, called by the Malays the 'Ram Bird,' is the most beautiful of the Malacca birds, and is known to naturalists as the blue-billed gape. —*Wallace* 1 28

**CYMOPOGON SCHÆNANTHIUS**  
 SPER syn of *Andropogon sebænanthus*, *Linn*  
*Cymbopogon Iwaranchusa* is the kham of the  
 Panjab

**CYNANCHUM Populus Euphratica**, a  
*Cynaneum*, *Chloris barbata*, and *Cyperus*  
*austatus*, all ascend to 11,000 feet in Ladak,  
 are remarkable instances, as is *Peganum*  
*harmala*, which attains 9000 feet — *H et T*

**CYNANCHUM ARGEL** In small doses,  
 the leaves are purgative, and they are much  
 used in Egypt for adulterating senna. The In-  
 dian or Tinnevely senna, is not liable to this  
 adulteration, to which many practitioners at-  
 tribute the severe griping which senna often  
 occasions — *O'Shaughnessy*, p 450

Kirshuf	APAB	Artichoke	ENG
Kharchhof	"	Garden Artichoke	"
Kharsjuf	EGYPT	Kanjur	HIND PRS

This plant has very large flowers, of a violet  
 blue colour

**CYNARA CARDUNCULUS**, the car-  
 doon, is similar to the garden artichoke,  
 but grows much higher, though cultivated  
 similarly to the artichoke, indeed, plants  
 of the latter, which grow to a large size  
 might be used as cardoons, in order to  
 prepare this vegetable, the leaves of the ar-  
 tichoke should be cut down, not destroying  
 the heart, at the commencement of the rains,  
 after the young leaves grow to the length of  
 two feet, they should be tied together in a bun-  
 dle, and earthed up like celery, at least one  
 foot of earth should be raised round the plant.  
 They will be fit for use in three weeks or a  
 month, raised from seed. The plants, when a  
 good size, require to be planted 2 or 3 feet  
 apart in good soil. The tender stalks and  
 leaves, when blanched, are used for soups and  
 salads — *Riddell Jaffrey*.

**CYNGHALESE**, the people of Ceylon,  
 also their language

**CYNIPS GALLÆ TINCTORIA.** See  
 Galls

**CYNOCEPHALUS Cuv** A genus of qua-  
 drumminous mammals, known as baboons.  
 The generic name *Cynocephalus*, means, in  
 the Greek, "dog-headed." The most mark-  
 ed and prominent of the characters which  
 more immediately distinguish the baboons  
 from the other *Simiæ*, consist in the great  
 prolongation of the face and jaws, and in the  
 truncated form of the muzzle, which give the  
 whole head a close resemblance to that of a  
 large dog. In their native mountains,  
 the ordinary food of the baboons is berries  
 and bulbous roots, but in the vicinity  
 of human habitations, they make incursions  
 into the cultivated fields and gardens, and  
 destroy a still greater quantity of grain and  
 fruits than they carry away with them.  
*C Hamadryas*, *Linn*, the 'Derrias' is found  
 in Africa and in the mountains of Arabia.  
 It measures upwards of 4 feet when standing  
 erect — *Eng Cyc* See Mammalia

**CYNOCTONUM PAUCIFLORUM, DE-**  
**CAISNL**

*Cynanchum pauciflorum*, *R Br*, *W Ic*, not  
*C pedunculatum*, *Thumb* Kang-Koombla SINGH

Very common in the central province of  
 Ceylon. The Singhalese eat the young leaves  
 of this, and of many other plants of this na-  
 tural family, in their curries. Dr Wight, in  
*Leones*, gives *C album* and *C calhalata* —  
*Thw Enum Pl Zeyl* p 195.

**CYNODON DACTYLON, PERS**

<i>Panicum dactylon</i> <i>Linn</i>	<i>Agrostis linearis</i> <i>Retz As</i>
<i>Roxb.</i>	<i>Res</i>

Doob, Doobli "	Durva SANS
Harali DUK	Hurram Pillu TAM
Hurryalee grass ANG DUK	Arugam pilu "
Creeping Cynodon ENG	Garik Kasuvu TEL
Ghaner HIND	Tell Gariki "

The *Cynodon dactylon*, or Hurryallee grass of India, is considered the best for cattle. The root creeps through the loose soil to a considerable extent, and has strong fibres at the nodes. The stem rarely exceeds six inches in height. Florets are all on one side of the spike-stalk, awnless, purplish, and ranged in two close alternate rows. All the stems which lie near the ground take root, and by this means, though an annual plant, it increases and spreads very wide. It yields abundance of seed, of which small birds are very fond. It is good to allow the seed to ripen before the hay is cut, as it then propagates itself by seed, in addition to the runners. This grass is found in Great Britain, but its produce and nutritive properties are there comparatively insignificant, while in India it constitutes three-fourths of the pasture. Sir W. Jones observes (As Res. vol. 4 p. 242) that it is the sweetest and most nutritious pasture for cattle, and its usefulness, added to its beauty, induced the Hindoos, in their earliest ages, to personify it as the mansion of a benevolent nymph, the A'thaivana Veda thus celebrates it: "my Diva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth a hundred years."

It is the principal one of the Indian grasses, and is perhaps the most generally diffused, possessing much nourishing property in its long stems, no less than in its leaves. It endures the greatest elevation of temperature, as its roots penetrate far below the surface, and although, during the dry monsoon, giving no sign of life, it puts forth its tender leaves on the first approach of the rains. It grows throughout the year, and lawns and pastures of moderate extent are made by planting pieces of the creeping stems. It is also much used for forming a covering for the banks of rivers, ramparts and esplanades, the young and tender leaves are used in chatnies, and are considered very pleasant, the roots make a cooling drink. It is, also, one of the most abundant grasses on the Tenasserim coast, but it is much less conspicuous than many others.—*Mason Cleghorn Jaffrey*

**CYNOSURUS CORACANUS** LINN  
syn of *Eleusine coracana*. It is the korakan of the Tamuls, and the Ragī of the Dekhan, and is made into dark brown cakes. See Gramineæ

**CYORNIS BANYUMAS** HORSFIELD, is a well known Javanese bird, only twice procured in India,—viz by Mr Jerdon in the Nilgiris, and near Calcutta.—*Jour. Ben. As. Soc. No 5, 1856 Cal. Rev.* See Birds

**CYPERACEÆ** The Sedge tribe, a natural

order of plants, species of which are found from the arctic to the antarctic circle, in marshes, ditches, and running streams, in meadows, on heaths, in groves and forests, on the seashore, and on mountain summits, wherever phænogamous plants can exist. In Griffith's herbarium are 345 species of Indian Cyperaceæ, collected from the Himalaya to Mergui. The most useful of them are species of *Cyperus*, *Euphorium* and *Papyrus*. *Anosporum monocephalum*, Nees, one of the Cyperaceæ, is Roxburgh's *Cyperus monocephalus*, and the Gothoobi of Bengal.—*Voigt*

**CYNOGLOSSUM**, a genus of the Boraginaceæ, natives of Europe, pretty little annuals, flowers mostly blue, purple, white and purple, grow in any common soil.—*Riddell*

**CYNOMETRA** The men-ga, Burm. is a small tree of Martaban, and makes good small posts, &c, but is chiefly used for fuel. It is abundant in the lower provinces, but grows in the upper when planted, which is sometimes done for fuel.—*Malcolm's Travels in South Eastern Asia Vol 1 p 191*

This plant grows on the Coromandel coast near the sea, its roots are used as flour in times of scarcity. They are eaten roasted or boiled. This was first brought to the notice of Europeans by the late Dr James Anderson, who, in an excursion he made to the southern part of the peninsula of India, discovered that the Sheelaudie arise, from growing in sandy situations by the sea side, and requiring but little water, was the common food of the natives during a famine and when other grains are scarce. It is nutritious, pleasant to the taste, and makes a pudding somewhat resembling that made of sago. Dr Anderson, with that kindness and benevolence which ever distinguished him, disseminated the bulbous roots of this curious plant wherever he thought from their particular qualities they could be beneficial —*Ainslie*, p 250 *Useful Plants*, *Roxb* *O'Shaughnessy* p 628

CYPERUS BACHA HAM syn of *Cyperus inundatus*, *Lindl*

CYPERUS CAPITATUS RETZ syn of *Cyperus bulbosus*, *Vahl*

CYPERUS ESCULENTUS, the esculent cyperus. The toasted roots have been used as a substitute for coffee, and yield a preparation resembling chocolate. The cultivation

of the plant deserves attention for its considerable alimentary value —*O'Shaughnessy* 628

Its roots are fibrous with small bulbous extremities. It is employed as a diaphoretic in India, is prescribed in decoction in fever cases and is reckoned a valuable remedy when there appears to be a tendency to dropsy in the habit —*Ains Mat Med* p 84

CYPERUS JUNCIFOLIUS See *Cyperus rotundus*

CYPERUS LONGUS See Galangal

CYPERUS PANGOREI ROTTL syn of *Papyrus pangorei*, *Nees*

CYPERUS PAPYRUS, of the Egyptians, belongs to this genus, and is still called babier in Syria. It is about 15 feet high, the exterior tunic of the stems cut in bands, and pressed, formed the paper of ancient Egypt and Europe, the leaves, which are several feet long, served for the same purpose, but were of inferior quality. This paper is but little liable to decay. Pliny, for instance, relates that the book of laws of Numa Pompilius was found in Rome in a high state of preservation after having been buried nearly six centuries in the earth. *O'Shaughnessy*, p 628

#### CYPERUS PERTENNIS ROXB

Nagur Moothee, BENG	Kola Tungu Muste, TEL
Naga	

Roots aromatic, employed as a hair perfume  
—*Roxb* 1 198 *Voyag* 722

CYPERUS PROCERUS *ROXB* Syn of  
*Cyperus inundatus*, *Roxb*

CYPERUS ROTUNDUS *ROXB* Syn of  
*C hexastachyus*, *Rottl* var

CYPERUS STOLONIFERUS See *Jatamansi*

CYPERUS TEGETUM, *ROXB* Syn of  
*Papyrus pangorei*, *Nees* Used in India for  
mat making — *Royle*, p 389

CYPRÆIDÆ, the cowries, or cowry family  
of shells, the Porcellanen of the Germans and  
Porcelaines or Porcelain shells of the French,  
is a family of Molluscs, the classification of  
which may be thus shown

FAM VI Cypræide, Cowries

Genus *Cypræa*, recent 150, sp fossil 78 sp

Sub-genus *Cypræula*

*Lupoma*

*Trivra*, recent 30 sp

Genus *Eritia* rec 8 sp fossil 2 sp

Ovulum rec 36 sp fossil 11 sp

Sub-genus *Calpurnia*, 2 e

*Woodward*, Recent and Fossil shells See Cowries

CYPRÆA ARGUS, occurs at Ceylon, and  
a pair has been sold for four guineas *C*  
*Moneta* is used in many parts of the East as a  
circulating medium and for ornamenting the  
dress of several races, and the trappings of  
animals See Cowries

CYPRICARDIA, CYPRINA, two genera  
of molluscs

CYPRESS. Tir-zah, HEB An evergreen  
forest tree, a native of the south-eastern parts  
of Europe, particularly of Italy, Mexico, and  
the southern parts of N America There are  
several species of this class of evergreen trees  
The twisted cypress (*Cupressus torulosa*)  
occurs in the N. W Himalaya, in a solitary  
up at the junction of the Budhil with the

but is not found further to the west It  
and in the Sutley valley between Rampur  
Sungnam at an elevation of 6,000 to 8,000

The wood is hard, elastic, strong, resists  
firms, and its odour repels insects from  
whatever may be contained in a cabinet or  
chest made of it Its duration is very con-  
siderable, but the precise period to which the  
tree lives has not been clearly ascertained The  
cedar-wood of Japan, according to Thunberg,  
is a species of cypress — *Cleghorn*, *Punjab*  
*Report*, p 63 See *Cupressus*

CYPRESS, CREEPING ENG Syn of  
*Juniperus communis*

CYPRESS SHRUB. Syn of *Lawsonia*  
*alba* Lam

CYPRINUS Var

Sayl, DUK | Sayl Kunde, TAM  
Tambara, MALAY

*Ains Mat Med* p 156

CYPRUS VINE *Ipomea quamoclit*

CYPSELUS, the Swift genus of birds, of

which there are several species in India Along  
the river-banks, where high enough, the small  
Indian Bank Martin (*H Sinensis*) occurs  
abundantly, there are two non-migratory  
swifts, the common House Swift (*Cypselus*  
*affinis*) and the little Palm Swift (*C bala-*  
*siensis*) The great spiny-tailed swift of the  
Himalaya (*Acanthylis nudipes* of Hodgson)  
was obtained, a few seasons back, in England  
Mr Gould identifies this British-killed bird  
with his *Ac caudacuta* of Australia, but it  
appears identical with the Himalayan species,  
upon comparing Himalayan specimens with  
Mr Gould's plate, no difference can be detect-  
ed The great Alpine Swift, (*Cypselus melba*)  
is common to the Himalaya, the Nilgiris, and  
high mountains of Ceylon, but the great  
*Acanthylis* of the Himalaya has never been  
observed in S India, and is replaced in the  
Nilgiris, Ceylon, and also across the Bay of  
Bengal, (in Penang, &c) by a distinct species,  
the *Ac gigantea*

CYPSSELIDÆ A family of birds com-  
prising,

Sub-fam *Cypselinæ*, 3 gen 11 sp viz 3  
*Acanthylis*, 6 *Cypselus*, 2 *Collocalia*

Sub-fam *Macropteriginæ*, 1 gen 3 sp  
viz 3 *Macropteryx*, *coronatus*, *klechlo*, *comatus*

*Cypselus apus* 'Common Swift' of  
Europe, N Africa, W. Asia, Afghanistan,  
migratory

*Cypselus melba*, *C alpinus*, the 'Alpine  
Swift' High mountains (chiefly) of Europe,  
Asia, and Africa tolerably common in the  
Himalaya, Central India, Nilgiris, and Ceylon  
rare in Britain

CYPRINIDÆ, a family of Fishes of the  
order Physostomi, the species of which are  
distinguished by their having the mouth small

The family is classed into fourteen groups  
viz —

<i>Catostomina</i>	<i>Semiplatna</i>	<i>Hypophthal</i>
<i>Cyprinina</i>	<i>Xenocypridina</i>	<i>Michthya</i>
<i>Rheteichthya</i>	<i>Leuciscina</i>	<i>Abramida</i>
<i>Leptobarbina</i>	<i>Rhodeina</i>	<i>Hemipterina</i>
<i>Rasbora</i>	<i>Danionina</i>	<i>Cobitidina</i>

in which are 110 genera and about 690 spe-  
ces *Engl Cyc* page 219 See Fishes

CYROPOLIS, erected by the opponent of  
the Getic queen Tomyris

CYRTODACTYLUS MACULARIUS

*Blyth*, apparently affined to *C Marmo-*  
*ratus*, (*Kuhl*), of the Malay countries, with  
tail granular, beneath as in that species  
scales on throat minute, becoming gradually  
larger to the abdomen The very young  
have probably the crown black, a broad black  
band across the nape, two others upon the  
body, between the fore and hind limbs, an-  
other where the hind-limbs are articulated,  
and three more upon the tail, besides its black

tip the interspaces being of a fine rosy car-  
neous hue, with a few black tubercles inter-  
persed among the numerous pale tubercles  
limbs and under-parts spotless, on the for-  
mer slightly marked. In a specimen not  
half grown, the interior of the black bands is  
pale and speckled with black, the margins  
continuing black, and it is probable that the  
dark hue ultimately disappears from the in-  
terior of the patches. In a specimen under  
examination, the dark hue appeared to have  
almost left the crown, its blackish margin  
only remaining, as a streak from the nostril  
through the eye and continued round to join  
its opposite upon the occiput crown and  
cheeks mottled with dark spots more or less  
confluent, and the interspace from the occi-  
put to the nape-band has many black tuber-  
cles. Mr Theobald informs that the species  
attains more than six inches, and when alive  
is remarkable for the beauty of its prevailing  
rosy-carnaceous hue. It probably attains the  
size of *C. pulchellus*, from the Punjab Salt  
Range — *Mr Blyth*

#### CYRTODACTYLUS MARMORATUS.

See *Cyrtodactylus maculatus*

#### CYRENA FUSCATA. See Veneridæ

#### CYRTOPHYLLUM FRAGRANS

The Anan of the Burmese, grows in Moulmein.  
Is one of the nux vomica tribe, and one of  
the hardest, most compact and heaviest  
woods known — *Cal Cat Ex.* 1851

**CYRTUS INDICUS** Bloch, a fish of the  
Indian seas, of which large quantities are  
dried, and consumed by the natives of India.  
Plate 277 of Cuvier and Valenciennes repre-  
sents the fish much too red — *Cantor*

**CYRUS**, is said by most authorities to  
have lived B C 545, and to have conquered  
Babylon B C 504, other dates are given,  
but this is the generally accepted date of the  
fall of Babylon. Its capture by Cyrus is  
foretold in Jer i 1 to 35, Dan viii and  
Is xxi 2-9. Its power must have been  
much detested, if the expressions anticipato-  
ry of its after fall be considered. Isaiah  
says, xxi. 2-9, "Go up, O Elam! besiege  
O Media! \* \* \* Babylon is fallen, is fallen,  
and all the graven images of her gods lie  
broken into the ground." Jeremiah says,  
li. ver 37, "and Babylon shall become  
heaps, a dwelling place for dragons, an

astonishment, and an hissing without an  
inhabitant." Babylon fell before the arms  
of Cyrus about B C 504. Nicotris, the  
queen mother, counselled resistance, and as  
there was an ample supply of food with walls  
350 feet high and 87 thick, it seemed possible  
to withstand the siege. But after it lasted  
two years, Cyrus opened the head of the ca-  
nal connected with the Euphrates, and allow-  
ed its waters to enter the trenches with  
which he had surrounded the city. This so  
dried the bed of the river where it entered  
the city, that by midnight the two bodies of  
soldiers whom he had posted at the points of  
its entrance and exit passed in and opened the  
gates for the army who poured in and sur-  
rounded the place, and within a few hours the  
city surrendered. Towards the north of the  
province of Fars (according to Mr Moutr),  
Mader-i-Sulim marks the tomb of Cyrus,  
son of Cambyses — *Ouseley's Travels* Vol i p  
104. *Mignan's Travels*, p 168. See Fars  
India 311, 313, Inscription 371, Persian  
Kings

**CYRUS RIVER** The principal streams of  
the province of Fars are the Bendamir or  
Araxes, which receives the Kur-ab or Cyrus,  
as it falls into lake Bakhtegan and the  
Nabon, whose course is from Firuzabad south-  
ward to the Persian Gulf. In this country  
are also the higher parts of the two branches  
of the Tab

**CYST** See Burial. Cairn
